A Study on Nutrient Analysis of Mid-Day Meal

Maria Mansoor¹, Rahila Rawoof²

^{1,2}Department Of Nutrition & Dietetics, Anwarul Uloom College, Mallepally, Hyderabad.

Abstract: *The Mid Day Meal Scheme initiated by the Government of India is the largest school feeding programme in the world with an aim of providing hot cooked nutritious meal to school students of government schools and government aided centres. The present study was conducted to evaluate the nutritional content of the mid day meal as one of the major objective of this scheme is to improve nutritional status of school going children. The study also focused on the hygienic practices in school among students, cook cum helpers and the lunch area surroundings. Sample of rice and dal with peas and potatoes mid day meal was collected from a government school 5gms of each sample was sent to a laboratory in a dehydrated form to carry out to assess the major nutrient content which included carbohydrate, protein and fat. Observation method was implied to check the hygienic conditions. News about the MDM scheme was kept under track for a period of three months to understand the consequences of the scheme. The study findings suggested that although there is are standard nutritional norms for the MDM, the calorie content of the given sample did not meet the standards both for primary and upper primary students, it was less by 16% and 22% respectively. The protein content was met because of addition of green peas in the dal. 100gms of dal gave 39% protein, 59% carbohydrate and 2% fat and 100 grams of rice gave 87% carbohydrate and 13% protein with NIL fat. The one third RDA of 10-12 year old children was compared to the complete meal nutrient content which resulted in inadequate carbohydrates and fat for both girls and boys. However the protein requirement was met successfully. The fat content in the meal increased when an egg was provided in lunch on alternate days of the week, yet it did not meet the adequate one third of the day fat requirement. Hygienic conditions were observed to be poor with no proper lunch area, no use of gloves and head covers by the food handlers. When the news was kept in check majority of it was reported to be complaints regarding the MDMS be it either unhygienic practices, students falling ill after its consumption or irregular delivery of meals.*

I. INTRODUCTION

The term Mid day meal programme refers to the school meal programme in India. It involves provision of lunch/snacks/meal free of cost to school children on school working days. There were a lot of variations over the years after implementation of the scheme. The coverage of more than 12 crore children in rural and urban areas under the scheme makes the mid day meal programme one of the largest nutrition support schemes in the world [1]. It first began in Chennai in 1925 for the students in Madras Municipal Corporation and in mid 1980s the state of Kerala, Gujarat and Tamil Nadu along with Union Territory of Pondicherry had universalized a cooked Mid Day Meal Programme with their own resources for children studying at the primary stage [2]. In October 2007, the scheme has been further revised to cover children in upper primary (classes VI to VIII). From 2008-09 i.e w.e.f 1st April, 2008, the programme covers all children studying in Government, Local Body and Government-aided primary and upper primary schools and the EGS/AIE centres including Madarsa and Maqtabas supported under SSA of all areas across the country[2]. Food norms have been revised to ensure balanced and nutritious diet to children of upper primary group by increasing the quantity of pulses from 25 to 30 grams, vegetables from 65 to 75 grams and by decreasing the quantity of oil and fat from 10 grams to 7.5 grams[3]. The calorific value of a mid-day meal at upper primary stage has been fixed at a minimum of 700 calories and 20 grams of protein by providing 150 grams of food grains (rice/wheat) per child/school day[4]. The major objectives of the mid day meal scheme are Improving the nutritional status of children in classes I – VIII in Government, Local Body and Government aided schools, and EGS and AIE centres, Encouraging poor children, belonging to disadvantaged sections, to attend school more regularly and help them concentrate on classroom activities. Providing nutritional support to children of primary stage in drought-affected areas[2]. Mid-Day Meal is run both on centralised mode and decentralised mode. In the decentralised mode, Mid-Day Meal is being cooked at school points. In the centralised mode, Mid-Day Meal is being cooked in the Centralised Kitchen by NGOs & hot cooked meal is carried to the schools for consumption by children[5]. The state government of Telengana proposed additional guidelines for the welfare of the students and it not only covers classes I to VIII but also provides to students of class IX and X from its own resources. The guidelines also suggest of providing boiled egg/ banana twice a week from its own resources. Other features are providing super fine quality rice, Creation of monitoring cell for regular review of scheme, Training of cook cum helpers, IEC (Information communication education) activities carried out through CDS and Posters[6]. The Monitoring Institute (MI) has observed that in sample schools of Hyderabad District, 3247 (42.88%) children are availing the Mid-Day-Meal out of 7572 enrolled children. In case of Upper Primary Schools, 566 (50.67%) children are availing the Mid-Day-Meal facility out of 1117 enrolled children[7]. The school age period is the latent time of growth. Girls usually out distance boys by the latter part of the period. The nutrient requirement by boys and girls are similar till the first 9 years after which there is a variation. A packed lunch should meet

one- third of the daily requirement of calories, protein and other nutrients of the child, therefore is it necessary that the mid day meal lunch provided to students in schools meet the one- third requirement[8]. ". The Government's idea was reflected in the mid-day meal guidelines of the National Programme of Nutritional Support to Primary Education (NP-NSPE) in 2006.4 policy introduced management monitoring and evaluation (MME) for the MDMS and management guidelines to ensure the quality of food. Ministry of Human Resource Development (MHRD) issued A detailed guideline in 2009 to ensure that the meal met prescribed nutritional standards. This was reiterated while highlighting the role of the MDMS in fighting widespread anaemia – "As per MDMS guidelines green leafy vegetables should be added in the MDMS meal so that the children get the nutritional benefits and one portion of the iron of the day can be fulfilled". As nutrition and hygiene are among the main challenges of the Mid day meal programme. Out of the 876 test reports of mid-day meal samples in Delhi from 1 January 2012 to 31 March 2013, more than 90% failed to meet the standard of 12 gms of protein and 450 calories. A number of loopholes in the scheme need to be plugged if nutritious food, not just something cooked, is to reach the plates of poor students.[9]. The present study was aimed To determine the amount of major nutrients (carbohydrate, protein and fat) in the given mid day meal sample and assess if the mid day meal meets the standard guidelines along with checking the hygiene conditions when the mid day meal is served.

II. METHODOLOGY

In order to evaluate the nutrient content of mid day meal, a sample of a day's mid day meal served in a government school in Hyderabad was collected. A well established organization which executes the governments scheme of providing hot and nutritious mid day meal was in charge of supplying the meal in this school along with many other schools of the city. Everything that was being provided was collected as a sample which included a dal preparation and cooked rice. , both the samples were heated to remove all the moisture content completely and dehydrate. 5grams of each sample was sent to the Quality Control Laboratory of Professor Jayashankar Telengana State Agriculture University, Rajendranagar, Hyderabad for the analysis. The 3 major nutrients- carbohydrate, protein and fat of the given sample were examined. the obtained values for the sample were then calculated to check if it meets one-third of a child's daily nutrient requirement. The age group of 10-12years was selected as the children in upper primary classes (VI-VIII) are of this age group. The Recommended Dietary Allowances for this age group were taken from the ICMR Recommended Dietary Allowances for children 6-12years-2010. Observation method was chosen to assess the hygiene conditions during the serving of mid day meal. It included the delivery of meal, serving methods, hygiene conditions of the staff, utensils used, eating/ lunch area provided to students and the hygiene rules to be followed by students.

III.RESULTS AND DISCUSSION

Fig 1 shows the amount of carbohydrate and protein in the given 100grams of rice sample. It is seen that rice sample consists of 87% of carbohydrates and 13% of proteins. There is no trace of fats seen.

Fig 1 shows carbohydrate and protein content in 100grams of rice sample.

Fig 2 shows the amount of carbohydrate, protein and fat in the given dal sample.

Fig 2 shows the amount of carbohydrate, protein and fat in the given sample of 100grams of dal sample. It is seen that dal sample consists of 59% of carbohydrates and 39% of proteins and 2% fat.

Fig.3 – Calorie Comparision Of The Standard And MDM Sample(Primary)

Fig 3 shows the total calorie content in the mid day meal provided to students on that particular day compared to the actual calorie content the mid day meal is supposed to provide to a student per day. It can be seen that the calorie requirement does not meet. In fact it is 16% less than the standard norms.

Fig 4 – Protein Comparision Of The Standard And Mdm Sample (Primary)

Fig 4 gives us the protein content in the mid day meal compared to the standard values. It is seen that the protein requirement is easily met for the primary school children. This might be because on the day when the sample was collected from school there were green peas added to the dal. Peas are also a good source of protein, hence, peas increased the overall protein content of dal preparation by 10%.

Fig 5 – Calorie Comparison and Protein Comparison Of The Standard And Mdm Sample (Upper Primary Students)

Fig 5 shows the total calorie content in the mid day meal provided to students on that particular day compared to the actual calorie content the mid day meal is supposed to provide to a student per day. It can be seen that the calorie requirement does not meet. It is 22% less than the standard norms. It can be due to nutrients lost during cooking or low quality grains. It also shows the protein content in the mid day meal compared to the standard values. It is seen that the protein requirement is easily met for the primary school children. This might be because on the day when the sample was collected from school there were green peas added to the dal. Peas are also a good source of protein, hence, peas increased the overall protein content of dal preparation by 4%.

Fig 6 – One Third Carbohydrate Rda For Girls (10-12years) Vs Intake In Lunch And One Third Carbohydrate Rda For Boys (10-12years) Vs Intake In Lunch

Fig 6 compares the difference between the actual intake of carbohydrate based on lunch provided 1/3 of the child's daily requirement and the amount provided through mid day meal. It is clearly seen that the lunch lacks the sufficient amount of carbohydrates by 10%. It also compares the difference between the actual intake of carbohydrate based on lunch provided 1/3 of the child's daily requirement and the amount provided through mid day meal. It is seen that the lunch lacks the sufficient amount of carbohydrates by 14% for boys as their RDA for carbohydrates is slightly more than girls

Fig 7 – One Third Protein RDA For Girls (10-12years) Vs Intake In Lunch & One Third Protein RDA For Boys (10-12years) Vs Intake In Lunch

Fig 7 shows that the mid day meal does a good job of meeting the protein requirement. This is mostly due to the addition of Green Peas in during the dal preparation on the day when sample was collected. The protein content is 24% more than the recommended values.

Fig 8 One Third Rda Of Calorie For Girls (10-12years) Vs Intake In Lunch One Third Rda Of Calorie For Boys (10-12years) Vs Intake In Lunch

Fig 8 shows the total calories provided by the mid day lunch compared to the one third of the day's calories that a lunch must provide to students. It is seen even though the protein requirement is met, the calorie content is not adequate enough. The lunch lacks 20% of calories needed for girls and The calorie content is 24% less than the ICMR RDA for boys of 10-12 years of age.

Fig 9 One Third RDA Of Fat For Children (10-12years) Vs Fat Intake In Lunch

Fig 9 represents the percentage of one third of the total fat needed by a child of 10-12 years old per day compared to the percentage quantity of fat a mid day meal lunch provides which usually consists of rice and dal. Only a mere 30% of the total recommended dietary allowance of fat is met by provision of dal and rice. The MDMS also includes provision of eggs on alternate days. On the day of collection of a complete mid day meal sample there was no egg given to the students as it had been given on the preceding day. Therefore it can be assumed that on the day's when an egg is provided in the meal the fat consumption is increased.

The state government of Telangana made new schemes of providing a Banana to students who do not eat eggs. On enquiry it was revealed that no banana's were ever sent to the school, only eggs were provided on alternate basis. This shows that this new scheme had not been implemented much effectively.

A. Hygienic Conditions

The hygienic conditions were inspected by the Observation method. It included checking the delivery area for mid day meal, hygienic state of food handlers and servers, the lunch area for students, serving equipment and utensils etc.

- 1) It was observed that there no proper place to receive the cooked mid day meal brought to the school in a vehicle from the designated foundation.
- 2) It was usually received in the school ground or back of the school building.
- 3) The menu for the day was displayed on the black board just outside the main corridor.
- 4) The helpers then took the cans containing cooked meal to the serving area which was noted to be an area of the school play ground.
- 5) No gloves were used by the food servers while serving the meal to students.
- 6) No appropriate clothing, head cover or apron was used.
- 7) The students made a proper queue to receive the meal.
- 8) The students had to bring their own empty lunch boxes, tiffins and plates in order to get the meal. There was no provision of lunch plates by the school authorities.
- 9) Some students followed the rule of washing hands before eating but most of them were not carrying out this cleanliness measure.

A proper, clean lunch area to be provided by all schools was nowhere to be seen. Students were observed having lunch in the school playground mostly. There was no specific place provided. In short students had their lunch wherever they could find a place to sit outside the main classrooms.

IV. CONCLUSIONS

From the above graphical representation of the nutrient analysis of mid day meal it can be concluded, even with some benefitting objectives the mid day meal does not meet the daily nutrient guidelines as per the MDMS as well as school lunch requirements.

V. ACKNOWLEDGMENT

The Authors would like to thank the HOD of Anwarul Uloom College for moral support and the laboratory to carry out the nutrient analysis.
