Investigational Study of Steel Fibre Reinforced Cement Concrete (SFRC) with Superplasticizer

Krishnakant Rathore[1], Prof. Archana Tiwari[2]
[1]*P.G. Student,* [2]*Professor, Department of Civil Engineering, Madhav Institute of Technology & Science, Gwalior, Madhya Pradesh, India*

Abstract: ***Fibre Reinforced cement concrete is broadly utilized now a days. Different types of fibres added are being used to improve the quality of concrete. In this work investigation is carried out to determine the effect of Super Plasticizers in Steel fibre reinforced cement concrete through a series of tests. Compressive quality of the control cubes and the compressive quality of steel fibre reinforced cement concrete containing superplasticizer is compared. The compressive strength of concrete containing Super Plasticizers and various percentages (0.5%, 0.75%, &1%) of steel fibre is determined after 7, 14 and 28 Days of curing stages. It is found that compressive strength of steel fibre reinforced cement concrete increases with the addition of superplasticizer and increase in percentage of steel fibre.***
Keywords: Steel Fibre, Superplasticizer, compressive strength, Initial and final setting time.

I. INTRODUCTION

Tensile strength of Plain cement concrete is very low; this leads to constrained pliability and tiny protection from splitting. In the solid concrete member inward micro cracks are naturally present due to its very poor tensile strength. These micro cracks, inevitably prompting to break the solid. Each kind of fibre has its specific properties and confinements. Different types of fibres being utilized in cement concrete are steel filaments, carbon, polypropylene, glass, nylons, asbestos sand coir fibre etc. They can be roundabout or level. The ratio of its length to its diameter is called as aspect ratio. Steel fibres are used in various types of civil structures.

II. MATERIALS USED

In this investigational work following materials are used cement, Coarse aggregate, Superplasticizer, water, fine aggregate, Steel fibre.

1) Steel Fibre: Brand Name: Perfect Solution, Pune

Table1. Properties of steel fibre (https://www.perfectsteelfiber.com)

S. No.	Physical Properties	Results
1.	Fibre type	Hook End
2.	Specific gravity	2.55
3.	Aspect Ratio	58
4.	Length	35 mm
5.	Diameter	0.60 mm

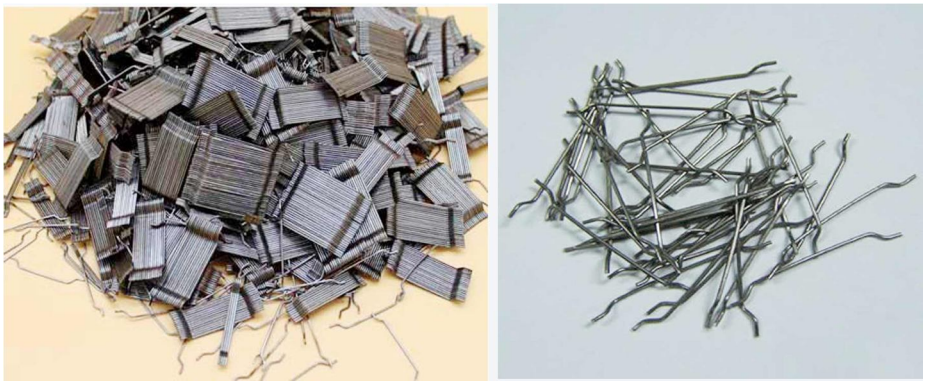

Fig. 1. Steel Fibre

2) *Water:* Potable water is by and large viewed as acceptable for blending concrete. Locally accessible drinking water is utilized for mixing.
3) *Cement:* OPC 43 grade cement as per IS 8112 was used. Brand Name: Ultra Tech

Table2. Properties of OPC

S. No.	Physical properties	Results
1	OPC Specific gravity	3.14
2	Fineness of OPC	5.26 %
3	Standard Consistency	33 %
3	OPC Initial Setting Time	55 Minutes
4	OPC Final Setting Time	210 Minutes

4) *Coarse Aggregate:* Nominal maximum size of aggregate was 20mm. It was collected from local material suppliers. Specific gravity of coarse aggregate was 2.85. Fineness Modulus of coarse aggregate was 6.91
5) *Fine Aggregate***:** Locally available River sand collected from local material supplier and passing through 4.75mm sieve was used. Its specific gravity was 2.67. The fine aggregate grading zone was II as per IS 383-1970.Fineness modulus of fine aggregate was 2.87
6) *Super Plasticizers:* Conplast Sp 430: Brand Name: Fosroc Chemicals, India, pvt. ltd.

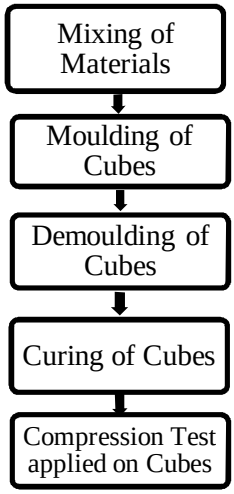
Table3. Properties of super plasticizer (https://www.fosroc.com)

S. No.	Physical Properties	Results
1..	Superplasticizer type	Conplast, SP 430
2.	Content of Chloride	Nil
3.	Specific gravity	1.225 at 30^0C
4.	Air entrainment	1 % Approx extra air is entrained

III. METHODOLOGY

First of All, weigh all the Materials i.e. Cement, Sand, Coarse aggregate, steel fibre, water, superplasticizer. All the materials were mixed by Mechanical Mixer. Control concrete and steel fibre reinforced cement concrete (with and without superplasticizer) samples (dimensions 150 mm x 150 mm x 150 mm) were prepared.

A. *Following Steps Are Follows In This Research*



B. Compressive Strength Test

Concrete samples of size 150mm *150mm *150 mm were tested for compressive strength. The table vibrator was utilized to compact the concrete in the moulds. The top surface of the concrete was smoothed. After 24 hours, the solid shapes were demoulded and were moved to curing water tank for different ages curing i.e 7 days, 14 days, and 28 days. After 7 days, 14 days, 28 days samples were tested on compression testing machine according to I.S. 516-1959. The failure load was noted. Compressive strength (MPa) = $\frac{\text{Crushing load}}{\text{cross}-\text{ sectional area}}$

Fig.2. compressive strength test on CTM Machine

IV. RESULTS

A. Compressive Strength Test

It is done via CTM machine. Solid cubes compressive strength were gotten at 7 days, 14 days, and 28 days. It is performed in our college Lab. The consequences of the tests are demonstrated as follows:

Table 4. Compressive strength of plain concrete with 0 % fibres

Days	Sample Designation	Compressive strength (MPa)	Average strength (MPa)

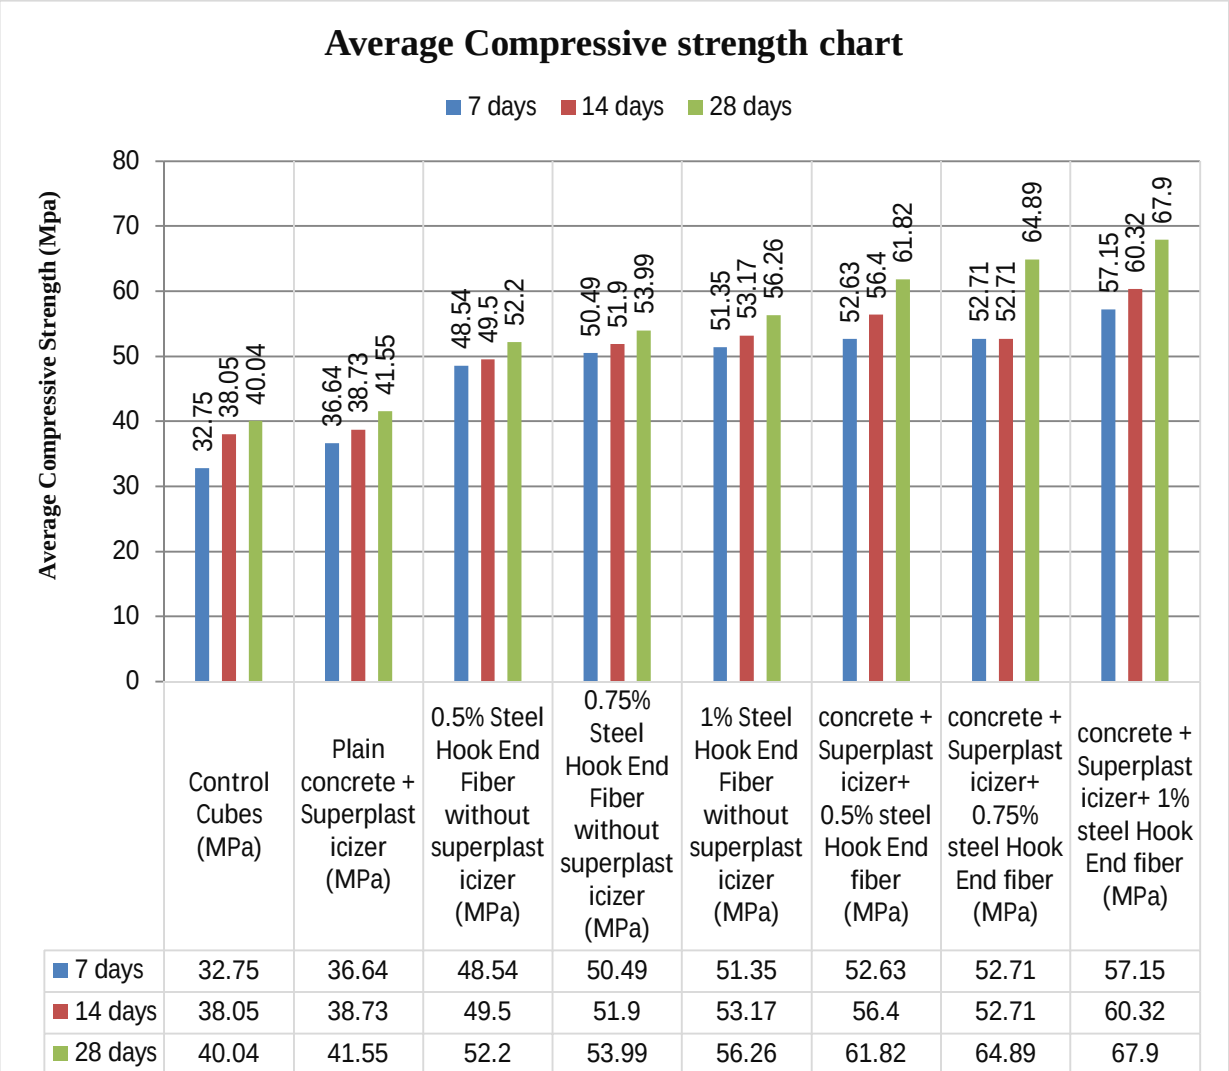
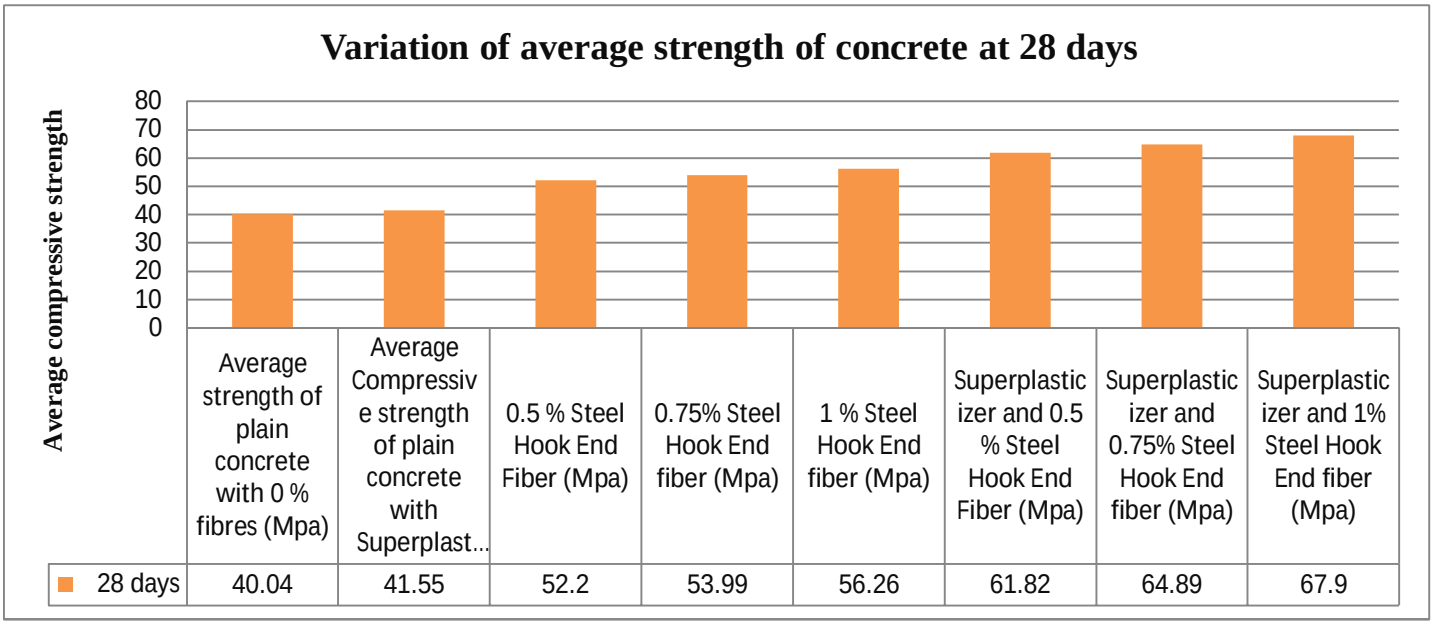
			0.5 % Steel Hook End Fibre	0.75% Steel Hook End fibre	1 % Steel Hook End fibre	Superplasticizer and 0.5 % Steel Hook End Fibre	Superplasticizer and 0.75% Steel Hook End fibre	Superplasticizer and 1% Steel Hook End fibre
28 days	40.04	41.55	52.20	53.99	56.26	61.82	64.89	67.90





V. CONCLUSION

The following conclusions could be drawn from the present investigations.

A. It is observed that compressive strength of concrete is on higher side for 1 % steel fibre as compared to that produced from 0 %, 0.5 %. 0.75 % steel fibre.

B. The addition of steel fiber and superplasticizer increases the compressive strength to a great extent.

C. The concrete containing 1 % steel fibre along with superplasticizer is having average compressive strength 68 % higher than the concrete without super plasticizer
