Preprocessing of Brain Hemorrhage Using CT scan

Warda M. Shaban¹, Dr. M. Morsy², Prof. Mohy ELdin A' Abo_ Elsoud³
Al Mansoura University Faculty of Engineering Electronics&Comm. Dept

Abstract--- One of the most common degradations in medical images is their poor contrast quality and noise. The idea of image enhancement technique is to improve the quality of an image for early diagnosis, and then followed by a noise reduction. This suggests the use of contrast enhancement methods as an attempt to modify the intensity distribution of the image such as histogram analysis which is performed manually and also this paper introduce a new approach for DICOM image is done by applying contrast stretching which is performed automatically, finally spatial filters applied to remove noise.

Keywords___ Preprocessing, Image Enhancement, Histogram analysis, Contrast stretching, and Noise removal.

I. INTRODUCTION

Generally medical images were poor quality in contrast and contain a lot of uncertainties (Fig.1) Show unenhanced CT image. Medical image enhancement improves visual appearance and enables identification of the desired region of the image. Medical imaging plays a leading role in modern diagnosis and contrast enhancement of medical images is useful in helping the radiologist or surgeons to detect pathologic or abnormal regions [1].The effectiveness image can be evaluated by comparing before and after results . All the algorithms of enhancement are carried out in MATLAB 2013b.

II. RELATED WORK

Image enhancement process consists of a collection of techniques that seek to improve the visual appearance of an image or to convert the image to a form better suited for analysis by a human or machine [2].The principal objective of image enhancement is to modify attributes of an image to make it more suitable for a given task and a specific observer. During this process, one or more attributes of the image are modified. Digital Image enhancement techniques provide a multitude of choices for improving the visual quality of images. A familiar example of enhancement is in which when we increase the contrast of an image and filters it to remove the noise "it looks better". Improvement in quality of these degraded images can be achieved by using application of enhancement techniques

Fig.1 Unenhanced CT image.

In the following section we aim to introduce the preprocessing algorithm of CT brain image.

A. Preprocessing

Since the dynamic range of the Hounsfield unit (H.U.) values for CT images is very large (1000 to +1000 H.U.), the first task is to select the appropriate range of gray level for extracting soft tissue regions. The relationship between gray level ($I(x, y)$) and H.U given as:

$$HU = I(x, y) + intercept \quad (1)$$

Where, the *intercept* value can be obtained from the meta information available in the DICOM header of CT volume data[3], So the first step is to convert dicom image into gray image (Mat2gray) means make normalization.(Fig.2) show the preprocessing result.

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

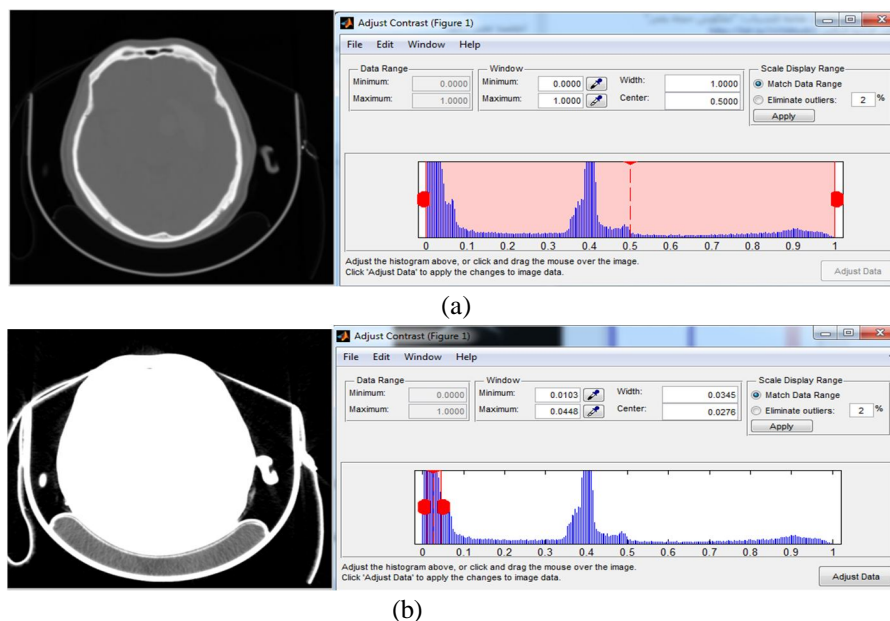

Fig.2 Preprocessing results a) Original dicom image, b) Histogram of original dicom image, c) Mat2gray of original image, d) Normalized histogram(0-1) .

1) *Image Enhancement*: This section aim to improve the contrast of the image to find the region of interest(ROI).

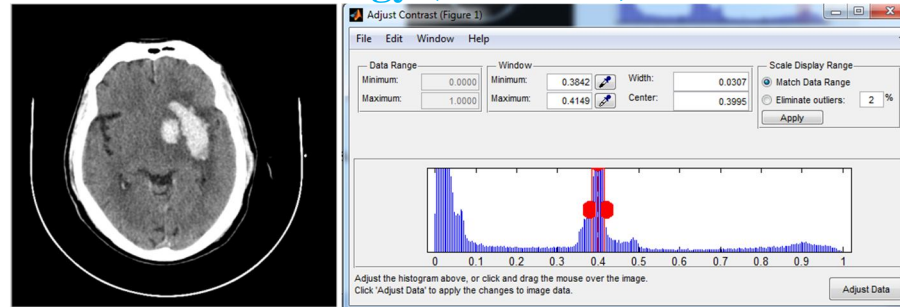

a) *Histogram Analysis*: CT scans produce 16-bit images consisting of 65, 536 different grayscale values. Only a small portion of these grayscale values contain information useful for the radiologists. Windowing in medical images refers to selecting the required range of grayscale values.

To get ROI which contain hemorrhage we can do that manually by using Matlab program and function (Imcontrast).

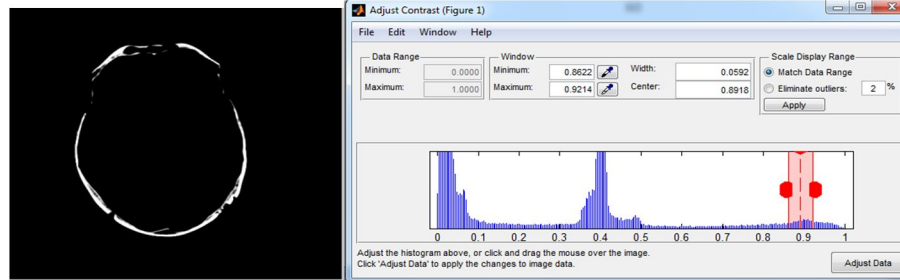

Imcontrast creates an Adjust Contrast tool in a separate figure that is associated with the grayscale image called the target image. The Adjust Contrast tool is an interactive contrast and brightness adjustment tool, in the following figure that you can use to adjust the black-to-white mapping used to display the image. When you use the tool, imcontrast adjusts the contrast of the displayed image by modifying the axes CLim property. To modify the actual pixel values in the target image..(fig.3)Explain the operation of manual analysis.

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

(c)

(d)

Fig.3 Explain the operation of manual analysis : a) Original dicom image with full range of gray level, b) Original image with gray level range (Min=0.0103, Max=0.0448) c) ROI with gray level (Min=0.3842, Max=0.4149), d) Hard tissue (Min=0.8622, Max=0.9214).

So the resulted image which contain ROI with gray level range (Min=0.3842, Max=0.4149).

Fig.4 Show the resulted image which contain ROI and its histogram.

2) Automatic method

a) *Contrast stretching*: This process basically improves the contrast in an image by stretching range of intensity values it encloses with the purpose to cover a desire variety of values [4]. We need to make a contrast stretching for CT brain image with the same tolerance range. By using MATLAB program and function stretchlim, imadjust we select the optimum tolerance (try and error). The tolerance range we use low-high 0.7, 0.916 (Fig.4) shows the original dicom image after contrast stretching and its histogram.

a) Original dicom image its histogram b) Image with gray level (Min.=0.3954, Max=0.4123)

Fig.5 shows the original image after contrast stretching and its histogram.

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

After represent the automatic method we should measure its accuracy to show its efficiency. First we should measure error let that:

$$\text{Error} = |\text{Approximate Value} - \text{Exact Value}| \quad (2)$$

$$\text{Percentage error} = \frac{|\text{Approximate Value} - \text{Exact Value}|}{|\text{Exact Value}|} \times 100\% \quad (3)$$

$$\text{Accuracy} = (1 - \text{Percentage error}) \times 100 \quad (4)$$

The efficiency of the proposed method is 97.08% .

B. Noise Removal

Noise reduces the quality of an image, if the brain CT image is very noisy then it will be very difficult to differentiate normal tissue and abnormal tissue and because of this there may be possibility of misdiagnosis. So image de-noising represents the crucial step in medical image analysis, so suitable filters are required for removing the noise[5].

CT images collected from the hospital were very smooth and noise level is very low so we can add noise (Gaussian noise and Speckle noise) to CT brain image to test which filter is perfect to remove.

By using MATLAB program and function (imnoise) we can add Gaussian noise and speckle noise at different variance (0.05-0.09-0.1).

First adding Gaussian noise to tested image as shown in the following figure:

Fig.6 Shows test image with Gaussian noise at a) Variance=0.05, b) Variance=0.09, c) Variance=0.1.

Adding Speckle noise to tested image as shown in the following figure:

Fig.7 Shows test image with Speckle noise at a) Variance=0.05, b) Variance=0.09, c) Variance=0.1.

Applying standard filter such as Median filter, Wiener filter and Gaussian filter to select which one is more suitable to remove noise

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

[6]:

1) Median filter

Median filtering is a nonlinear method used to remove noise from images. It is widely used as it is very effective at removing noise while preserving edges. The main idea of the median filter is to run through the signal entry by entry, replacing each entry with the median of neighboring entries.

$$F(X, Y) = \text{median}\{g(s, t)\} \quad (5)$$

2) Wiener filter

The wiener filter is used to convert the input image to desired output image in the best way as impossible. The best first solution is taken to be when the sum of the squares of the error is minimum.

3) Gaussian filter

Gaussian filter is a filter whose impulse response is a Gaussian function (or an approximation to it). Gaussian filters have the properties of having no overshoot to a step function input while minimizing the rise and fall time. Gaussian filter is a linear filter and it is given by the equation:

$$G(x, y) = \frac{1}{2\pi\sigma} \exp \frac{-x^2+y^2}{2\sigma^2} \quad (6)$$

The mask size is the function of σ . It controls the amount of smoothing, as σ increases more samples must be obtained to represent the Gaussian function accurately.

We can measure the performance of filter by using statistical parameters. The statistical parameters are calculated from the original $I(i,j)$ and filtered image $f(i,j)$. The parameters are Signal to Noise Ratio (SNR), Mean Square Error (MSE) and Peak Signal to Noise Ratio (PSNR)[7].

C. Estimation of SNR

SNR compares the level of desired signal to the level of background noise. The higher the ratio of SNR, the background noise is less obtrusive. SNR is defined as:

$$SNR = 10 \log_{10} \frac{\sum_{i=0}^{M-1} \sum_{j=0}^{N-1} [I(i,j)]^2}{\sum_{i=0}^{M-1} \sum_{j=0}^{N-1} [I(i,j) - f(i,j)]^2} \quad (7)$$

If $I(i,j)$ is the original image, $f(i,j)$ is the filtered image and $M * N$ is the dimension of the images.

D. Peak Signal to Noise Ratio (PSNR)

Power of corrupting noise that affects the fidelity of its representation. PSNR is defined as:

$$PSNR = 10 \log_{10} \frac{\max(I(i,j))^2}{MSE} \quad (8)$$

Where $\text{Max}(I(i,j))$, is the maximum possible pixel value of the image.

MSE (Mean square error) is an estimator in many ways to quantify the amount by which a filtered image differs from noisy image. If the value of MSE is low, we can say the quality of the image is better. The MSE is defined as:

$$MSE = \frac{1}{M*N} \sum_{i=0}^{M-1} \sum_{j=0}^{N-1} [I(i,j) - f(i,j)]^2 \quad (9)$$

If the value of PSNR is high, so the image quality is better.

Table (1): Image quality parameters after applying Gaussian noise and filtered image

Noisy image	Gaussian filter		Median filter		Wiener filter	
	PSNR	SNR	PSNR	SNR	PSNR	SNR
0.05	24.2111	15.0725	16.4800	7.3414	19.2583	10.1197
0.09	21.9790	13.3663	14.0899	5.4773	17.1067	8.4941
0.1	21.5971	13.089	13.6528	5.1449	16.7181	8.2102

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

Table (2): Image quality parameters after applying speckle noise and filtered image

Noisy image	Gaussian filter		Median filter		Wiener filter	
	PSNR	SNR	PSNR	SNR	PSNR	SNR
0.05	31.7001	21.4805	25.2879	15.2879	31.5389	21.3252
0.09	30.910	20.7384	23.1589	12.7681	30.8130	20.4402
0.1	30.7007	20.4602	22.8037	12.3873	30.6810	20.2646

Table(1) & Table(2) showing that Gaussian filter is more suitable filter to remove noise as it give higher peak signal to noise ratio than other filters.

III. SIMULATED RESULTS

A. Removing Gaussian noise

Filter	Variance		
	Variance=0.05	Variance=0.09	Variance=0.1
Median filter			
Wiener filter			
Gaussian filter			

Fig.8 Shows noise removal of Gaussian noise at different variance (0.05, 0.09, 0.1) using Median, Wiener and Gaussian filter.

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

B. Removing Speckle noise

Filter	Variance		
	Variance=0.05	Variance=0.09	Variance=0.1
Median filter			
Wiener filter			
Gaussian filter			

Fig.9 shows noise removal of Speckle noise at different variance(0.05,0.09,0.1) using Median, Wiener and Gaussian filter.

The last step is apply the selective filter to the original test image, (Fig. 10)show a) the original tested image, b) tested image after applying gaussian filter with peak signal to noise ratio PSNR=38.8164 and signal to noise ratio SNR=29.1086.

Fig.10 Shows a) The original test image, b) Test image after applying wiener filter.

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

IV. CONCLUSION

This study describes the method to improve the image quality of DICOM image. The goal of the image enhancement technique is to improve a characteristic or quality of an image, such that the resulting image is better than the original image, then removing noise that appear after enhancement.

V. FUTURE WORK

We will develop an algorithm for hemorrhage lesion region pre_segmentation and calculating area of the hemorrhage according to area of the brain.
