A Clinical Study of *Karkashchadaadi Kwath* in *Medodushti* with Special Reference to Dyslipidemia- A Study Protocol

Dr. Jyoti¹, Dr. Neelam Kumari², Dr. Neha Lamba³

¹M.D. Scholar, Department of Kayachikitsa, IASR & Hospital, Kurukshetra, Haryana, India

²Professor and Head, Department of Kayachikitsa, IASR & Hospital, Kurukshetra, Haryana, India

³Associate Professor, Department of Kayachikitsa, IASR & Hospital, Kurukshetra, Haryana, India

Abstract: Like other metabolic disorders, *Medoroga* (Dyslipidemia) is also troublesome. The burden is increasing day by day. It is caused by an abrupt change in lifestyle and dietary habits. In India, approximately 25–30% of urban and 15-20% of rural subjects suffer from dyslipidemia. Overall, raised cholesterol is estimated to cause 2.6 million deaths (4.5% of total) and 29.7 million DALYS, or 2% of total DALYS. It is estimated that abnormal cholesterol levels account for 56% of global IHD cases and 18% of all CVD cases. Statins are the recommended medication for dyslipidemia in contemporary medicine which has many side effects like headaches, nausea, vomiting, bowel upsets, sleep disturbances, muscle tenderness, myopathy, thrombocytopenia, fulminant hepatitis, etc. Keeping in view of the above limitations and side effects, this study has been chosen to fill the gap in providing a safe and effective line of treatment, as Ayurveda provides multiple formulations of *Medodushti* (dyslipidemia). So, an effort is made for a single-arm, randomised clinical trial to see whether *Karkashchadaadi Kwath* at a dose of 40 ml BD is effective in the management of 40 patients of *Medodushti* for 60 days. We will have follow-up on the 0th, 15th, 30th, 45th, and 60th days (during treatment) and the 75th day (post treatment). The changes will be analysed on the basis of subjective and objective parameters. Then the results will be analysed using unpaired *t* test for objectives parameters and non- parametric, Chi square test for subjective parameters or appropriate statistical methods will be used as per need.

Trial has been registered under the Clinical Trial Registry of India with CTRI/2023/07/054923

Keyword: Dyslipidemia, *Karkashchadaadi Kwath*, *Medoroga*, *Medodushti*, Metabolic syndrome.

I. BACKGROUND

Madhukosha mentions *sneha* as the factor that causes *meda* [1]. Excessive consumption of *sneha dravya* causes excessive deposition of *Meda* in the body. *Meda* is considered the prime *dushya* in several disorders, including *Medoroga*, *Prameha*, and *Sthaulya*. The aberrant build-up of *Medadhatu*, or *Medodushti*, consists of several *Medovikaras*, also called *Medoroga*. *Agni* derangement and the creation of *Aama rasa* lead to *Medodhatwagnimandya*, which in turn causes an incorrect and excessive generation of *Medodhatu*, the condition known as *Medodushti*. Meaning of *Medodhatu* A lipoprotein problem known as dyslipidemia is triggered by either an excess or reduction in lipoproteins during metabolism [2]. All that *Medodushti* is the predecessor of *Medoroga*.

Higher plasma total cholesterol (TC), low-density lipoprotein cholesterol (LDL-C), triglycerides (TG), or decreased high-density lipoprotein cholesterol (HDL-C) are the hallmarks of dyslipidemia, which is a major risk factor for the development and advancement of atherosclerosis, cardiovascular disease (CVD), and stroke. [3,4,5]

Since CVD continues to be a leading cause of morbidity and death worldwide, primary and secondary risk reduction strategies must include the management of dyslipidaemia. In India, approximately 25-30% of urban and 15-20% of rural population have Dyslipidemia. Although it is more common in men, it affects both genders. 30 to 40 years age group has tendency to high prevalence, but above 60 years it become markedly high. Total cholesterol concentration is greater than 200mg/dL (38.7 percent in men and 23.3 percent in women). Overall, raised cholesterol is estimated to cause 2.6 million deaths (4.5 percent of total) and 29.7 million DALYS (2% of total DALYS). Abnormal cholesterol levels are thought to cause 18% of all CVD and 56% of global IHD. [6]

Statins are recommended as the first-line therapy by International Clinical Practice for dyslipidaemia due to their ability to reduce cardiovascular events. However, side effects like myalgia, rhabdomyolysis, hepatobiliary problems, myositis, cognitive impairment, and early diabetes may occur. [7,8,9,10] Long-term use can increase these risks. For patients who are unable to accept the negative effects of these drugs that decrease lipids, managing dyslipidaemia continues to be a significant challenge.

कर्कशदलवह्निसलिलं शतपुष्पाहिंगु संयुक्तम् | पिबतो निहन्ति नियतं सर्वभवां मेदसां वृद्धिम् ||

(भा. प्र. मध्यम खण्ड, स्थौल्य चिकित्साधिकार ३९ / २०)

Karkashchadaadi Kwath, [11] which has *Patolapatra* (Leaves of *Tricosanthes dioecia*), *Chitrakamool* (Root of *Plumbago zeylanica*), *Shatpushpa* (Seed of *Anethum graveolens*), and *Hingu* (Resin of *Ferula narthex*) as contents, is mentioned in *Bhavparkash Madhyam khand Sthoulya Rogadhikar* as *medonashak*. It possesses the *Tikt*, *Katu Rasa (Taste)* *Laghu*, *Rooksha*, *Teekshan Guna with Katu Vipak* and *Ushan Veerya* which relieve *Agnimandya* and does *Rookshan*, *Chedan*, and *Lekhan* of *Meda Dhatu*; which is the major treatment principle of the *medohar chikitsa* mentioned by *Acharya Charak* in *Sutra Sthaan 21* chapter.

Several researches conducted in the past few years have indicated that Hepatoprotective potential has been proven of *Patol* [12,13,14] and *Chitrak* [15,16] possesses a range of pharmacological qualities like anthelmintic, antihyperlipidemic, antihyperglycemic antioxidant, antidiabetic, antipyretic, antimicrobial, hepatoprotective, anticancer, antifertility, antiulcer, antifungal, burns, and wound healing. Some pharmacological effects of *Shatpushpa* (*Anethum graveolens*) have been reported such as antimicrobial antihyperlipidemic and anti hypercholesterolemic activities. [17,18,19]

Occasionally, oral intake of *Hingu* may cause adverse reactions such as nausea, vomiting. If used without *shodhan* (Purification). *Bhavparkash* had suggested that *Hingu* can be used after the Purification by roasted it in the ghee to avoid any side effect of drug.

Unfortunately, cost-effectiveness, safety, innovation, and distinctiveness are not being met by the status of clinical research at this time. Numerous studies had demonstrated that their intervention greatly improved lipid profiles; nevertheless, the results may have been impacted by the fact that the randomization, blinding process, sample size calculation, and specific inclusion and exclusion criteria were not disclosed. The purpose of this single arm, randomised clinical trial was to evaluate the safety and lipid-lowering effectiveness of *Karkashchadaadi Kwath* in the treatment of dyslipidemia, since there haven't been many high-quality randomised controlled trials on this potential at this level.

II. METHODOLOGY/DESIGN

A. Trial Primary Objective

To determine the effect of drug on clinical parameters and biochemical findings associated with *Medodushti* (Dyslipidemia).

B. Trial Secondary Objectives

- 1) To suggest preventive actions in order to monitor the spread of disease across individuals and communities.
- 2) To standardize the ayurvedic line of treatment, both drug and dose which may have effective role in management of patients of *Medodushti* (Dyslipidemia).
- 3) To explain the *Medodushti* (Dyslipidemia) critical review on the basis of classical text of ayurveda and with the help of modern literature.
- 4) To rule out secondary causes that count for lipoprotein disorder.
- 5) To prevent the complication of Dyslipidemia like atherosclerosis, CAD, CVD & PVD.

III. STUDY DESIGN

This is the research plan for a 60-day treatment period randomized single arm clinical trial, which will be conducted between July 2023 and October 2024. Patient recruiting is currently Ongoing. Eligible patients are computerized randomly taken. The protocol was developed according to standard guidelines of Shri Krishna AYUSH University. And after approval from the Institutional Ethical committee and University Research committee.

The trial will last for sixty days. To evaluate the effectiveness of treatment, safety, and adverse effects, a total of six visits and one post-follow-up visiting have been planned at initial (visit 1), 15th day (visit 2), 30th day (visit 3), 45th day (visit 4), 60th day (visit 5), and 75th day (visit 6). Based on prior research and clinical experience, a 60-day therapy term was chosen. Furthermore, a thorough collection of potential prognostic criteria pertaining to patient and illness features has been made. Figure 1 shows the flow diagram of the trial.

A. Institutional Setting: Site of Study

Shri Krishna AYUSH University, sec-8 Kurukshetra, (HR) India's IASR Hospital will be the site of this study.

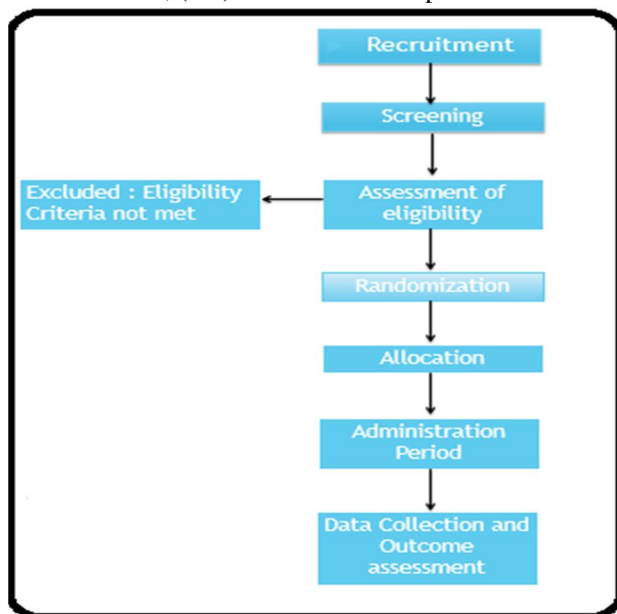

Fig 1 Study Flow chart

IV. RESEARCH QUESTION

To Check the Efficacy of *Karkashchadadi Kwatha* in *Medodushti* .

A. Hypothesis

Null Hypothesis (H₀) : There is no significant efficacy of *Karkashchadadi Kwatha* in management of *Medodushti* (Dyslipidemia).

Research Hypothesis (H₁) : *Karkashchadadi Kwatha* is significantly effective in management of *Medodushti* (Dyslipidemia).

B. Trial registry, Recruitment of Participants and Recruitment Techniques

This trial has been registered as a prospective study under CTRI/2023/07/054923 under the Clinical Trial Registry of India, and every participant will be sought out in IASR Hospital, Kurukshetra. Additionally, advertisement, via pamphlets will be posted within the facility Along with brief description of dyslipidaemia and *Karkashchadaadi Kwath* and investigators' contact details. The researchers can be reached by phone or in person at the OPD by those who are ready to involve in this trial. Individuals who volunteer to participate will be assessed in complying with both the inclusion and exclusion criteria.

Before any procedures linked to the study are started, eligible patients will be required to complete a written informed consent form. No one or any organisation associated with the study will ever be privy to the participants' personal information.

C. Study population, Inclusion criteria and Diagnostic standards

- 1) Diagnosed & confirmed cases of *Medodushti* (Dyslipidemia) & *Medoroga* .
- 2) Patients having underweight, normal weight, overweight, and class I obesity according to BMI.

a) Inclusion criteria

- Diagnosed & confirmed cases of *Medodushti* (Dyslipidemia) & *Medoroga* on the basis of criteria given by NCEP-ATP-III (Borderline High) [20] i.e. Serum Cholesterol \geq 200 mg/dl, Serum Triglycerides \geq 150mg/dl, LDL Cholesterol \geq 130mg/dl, HDL Cholesterol < 40mg/dl (male) and <50mg/dl (female)
- Age between 20 and 60 years, male or female
- Having freely provided their informed consent.

b) *Exclusion criteria*

- Individuals with a past medical history of- Unstable angina, Myocardial Infarction, Heart failure or stroke.
- Uncontrolled Hypertension (Diastolic Blood Pressure > 100 mmHg).
- Uncontrolled Diabetes Mellitus.
- Impaired Renal Function (Creatinine ≥ 2 mg/dl).
- ALT >2 times and AST >3 times of upper limit of normal (40 IU).
- Patient on steroid therapy and oral contraceptive therapy.
- Pregnant and lactating patient.
- Patient not fulfilling inclusion criteria.
- Patient not willing for clinical trial.
- Patient below 20yrs of age group and above 60yrs of age group.

D. *Randomization*

Computer generated randomization and Open Label technique will be applied to this Single arm interventional study.

V. INTERVENTIONS

A. *Pathya-Apthya and Lifestyle interventions*

As per the Ayurved Classics, The applicants will receive health education regarding nutrition and exercise. In this investigation, the individuals' food and exercise regimens will be considered crucial. A regular meal plan that fits the patient's needs in terms of *Pathya ahaar* – *Laghu* and *Supachya Ahaar* (easily digestible) or calories, protein, and carbs as well as a low-sugar, low-salt, and low-cholesterol diet will be recommended. It is advised that individuals engage in 20–30-minute sessions of moderate-intensity metabolic exercise. *Apthya Ahaar*, *Vihar* i.e. Risk factors will be strictly controlled, including alcoholism, smoking, and non-veg diet. It will be asked of the participants to follow a strict diet plan (*laghu ahaar*) and refrain from high-intensity or brief exercise.

B. *Pharmacologic Interventions*

A total of 40 patients with *Medodusti* (dyslipidemia) will receive lifestyle counselling and initial data collection, and they will be assigned at random to this trial study. Freshly prepared *Karkashchadadi Kwath* (Decoction) in a 40-ml dose and twice a day after 1 hour of food intake for 60 days will be given.

Every treatment taken during the study, along with its exact kind (generic version or generic name), its indications, date of administration, and dosage, must be meticulously documented in CRFs by the observer during each visit. The observer must also meticulously record whether the patient takes the medication on time. Throughout the trial, all lipid-lowering therapies—aside from the investigational medications—will be prohibited or limited.

C. *Outcomes*

1) *Primary Outcome*

The chief result is the percentage variation in Lipid profile and subjective criteria from baseline at 60th day.

2) *Secondary Outcomes*

The later results are as follows:

- a) SGOT, SGPT, TG, body weight, BMI, CBC, Serum creatinine, FBS, Microscopy and urine routine measurements will be made at starting point. (visit 1) and 30th day (visit 3), 60th day (visit 5), and 75th day (visit 6).
- b) All the subjective parameters mentioned in *Madhav Nidaan Medoroganidaan/3* will be evaluated every visit.

D. *Safety Assessments*

The safety assessments are as follows:

- 1) General physical examination.
- 2) Routine testing for blood and urine
- 3) Adverse events

E. Monitoring of Adverse Reactions

No such toxic effect noted so far in the trial drugs. It is safe to take it in therapeutic uses, also Investigators are required to promptly report adverse outcomes to the State Pharmacovigilance cell and the principle investigator by completing the "Serious Adverse Event form." The medical examiner is required to provide appropriate care based on the medications and symptoms, then thoroughly document and sign at the CRFs. The treating procedures must be disclosed to the principal investigator. Every unfavourable event should be promptly documented and monitored until it is adequately remedied or stabilised.

F. Participant and Assessment Timeline

Following the participant timeline indicated in Table 1, the evaluation indicated in Table 2 will be evaluated using the grading scale indicated in Table 3, which is based on the *Madhav Nidaan Medoroganidaan*, in that order. [21]

G. Laboratory Data Collection

Assessments of safety and validity will be conducted using laboratory parameters (see Table 1 for details). as stated during visits and at the start of the clinical study. Participants will get a thorough explanation of the biological specimen collected. The laboratory department of IASR Hospital or any other recognised and approved laboratory will measure lipid profiles, other blood exams, urine routines, and microscopic investigations.

H. Quality Control and Data Management

All investigators and pertinent personnel, such as physicians and researchers, and drug managers, will get uniform training and information about the trial-specific process before the start of the clinical trial. While completing the CRFs, investigators will refer to the participants' previous assessment records and inpatient care records.. The inspectors will routinely review all gathered data to make sure there are no errors or omissions. The investigator must sign and date the adjustments, and the original record of any amendment must be easily readable. The CRFs must then be delivered to the competent authority/ IASR or administration of Shri Krishna AYUSH University. It is necessary to document and preserve this data transfer procedure between investigators, inspectors, and data managers. Before entering data, the data administrator will double-check the information. For future use, all queries and responses will be stored in query tables. CRF data entry will be done on an individual basis. The primary investigator should examine the database with the data manager (supervisors) to get details on the volume of data and its logical content. The initial CRFs must be filled out manually when the patient is present after the authorization of supervisors and will be saved and preserved chronologically, the data and validation as required. According to the Quality Management Standard of the Clinical Trial Registry of India, all original files have to be maintained for the period given. As per protocol all the CRF with all the data will be handed over to the concerned authority of Shri Krishna AYUSH University with the approval of the supervisor after completion of the study.

I. Sample size Selection

The University authority set a capacity of 40 on the trial's sufficient sample size to finish the study on time for thesis work under the supervision of the investigator. This trial was cleared by the Research Committee of Shri Krishna AYUSH University.

J. Examining Statistics

A professional statistician will blindly analyse all of the data using statistical methods. The SPSS software 24.0 version or Graph Pad Prism 7.0 version will be used for all data analysis performed statistically. The information gathered on the basis of above observations will be subjected to statistical analysis in terms of mean (\bar{x}), standard deviation (S.D.) and standard error (S.E.). Necessary - Unpaired t test for objectives parameters and non- parametric, Chi square test for subjective parameters will be applied and further will be subjected to more applicable statistical test as per requirement. The obtained results will be interpreted as:

- 1) Insignificant - $P < 0.10$
- 2) Significant - $P < 0.05$
- 3) Highly Significant - $P < 0.001$

Every adverse event that occurs throughout the trial needs to be reported, together with information about its kind, intensity, and connection to the experimental medication. All adverse events will be classified as adverse events, along with any associated complications. Among them, the terms "certainly related," "probably related," "maybe related," and "suspected related" to the drug will be used conservatively.

K. Protocol Amendments

Although this study has been approved by the Institutional Ethics Committee and Research Committee of Shri Krishna AYUSH University after all the amendments, Furthermore, the major investigator and the Institutional Ethics Committee of Shri Krishna AYUSH University must approve any formal protocol amendments that may be necessary prior to implementation. Changes could have an impact on the study's methodology, the safety or potential benefits for patients, or both.

L. Observation and Examination

Supervisors should conduct routine monitoring to ensure that the data are timely, accurate, comprehensive, and properly documented in the case report forms (CRFs). The project management team (concerned authority of Shri Krishna AYUSH University) will conduct a standard and focused inspection at each stage of the investigation to assess if the study protocol is being followed.

VI. DISCUSSION

Numerous studies support the claims of antidiyslipidemic action declared in Bhavparkash Madhyam Khand *Shoulya Rogadhikar* regarding the medicinal benefits of *Patola*, *Chitraka*, *Shatpushpa*, and *Hingu*. As mentioned by Acharya Charak, the main treatment principles of the *Medohar Chikitsa* are *Guru Aptarpan*, *Agni Vardhan*, *Rookshan*, *Chedan*, and *Lekhan* of *Meda Dhatu*, along with the cleansing of channels. The drugs of *Karkashchadaadi Kwath* possess these qualities.

Concern over dyslipidemia, a metabolic disease that accounts for 29.7 million DALYS and 2.6 million fatalities in India, is rising. Side effects of modern statins include nausea, headaches, and disturbed sleep. Thus, the purpose of this study is to close the gap in the market by offering a low-cost, secure, and efficient course of treatment for *Medodushti* (Dyslipidemia). This study protocol compares the results of 60 days treatment period for 40 individuals in a computerised randomised single arm prospective clinical trial at *Karkashchadadi Kwatha in Medodushti*.

This study is conducted on a small sample size, and the outcome may be affected by the demographic area and Prakriti of the patient; hence, larger sample numbers and more well-planned research are therefore needed and can be performed for *Karkashchadadi Kwatha* in cases of dyslipidemia (*medodushti*).

- 1) *Trial status*: Patients are being recruited for this trial right now. The hiring process is scheduled to take place from July 2023 to October 2024.
- 2) *Acknowledgements*: The participants' time and interest in the research study are greatly appreciated by the authors.
- 3) *Funding*: The Shri Krishna AYUSH University in Kurukshetra, Haryana, India, may provide funding for this study.

A. Ethics Approval and Consent to Participate

The clinical trial research regulations and guidelines of Shri Krishna AYUSH University were followed in the planning of this study. The SKAU Ethics Committee has granted ethics approval for this trial protocol under reference number (SKAU/Acad/2022/6749). Patients will have enough time to decide whether or not to participate in the trial. Before recruiting, the researchers and investigators need to get each participant's signed informed consent. Participants will be asked to consent to the use of their files in case that they decide to leave the trial on the consent form.

Table 1: Participant/ Patient timeline

Research stage	Starting point		Duration of treatment			Following therapy
Item	0	15 th day ± 3 days	30 th day ± 3 days	45 th day ± 3 days	60 th day ± 3 days	75 th day ± 3 days
Visit no.	V ₁	V ₂	V ₃	V ₄	V ₅	V ₆
