Abstract—Cardio vascular diseases are the number one cause of death globally, taking an estimated 17.9 million lives each year, which accounts for 31% of all deaths worldwide. Heart failure is a common event caused by CVDs and this dataset contains 11 features that can be used to predict mortality by heart failure. In this project, a model is built using the Random Forest Classifier Algorithm using Auto AI and a web application is created using Node Red Application and it showcases the prediction of heart failure in a web based format. The usage of IBM cloud environment for implementing the Machine learning Model using IBM Auto AI and Node Red Flows are created for the display of Web Application Structure. The complete paper explains the coordination among the Auto AI and Node red in the Cloud Platform.

Keywords— Cardio Vascular Disease, IBM Auto AI, Machine Learning, Node Red Application, Watson Studio.

I. INTRODUCTION

Machine Learning [1] commonly deals with big data where the size of the data is massive and the data can be both in structured and unstructured format. It is difficult to identify heart disease because of several contributory risk factors such as diabetes, high blood pressure, high cholesterol, abnormal pulse rate and many other factors. Various techniques in data mining and neural networks have been employed to find out the severity of heart disease among humans. The nature of heart disease is complex and hence, the disease must be handled carefully. The proposed method which we use has 10 attributes for heart disease prediction and the problem is carried out using IBM AUTO AI service.

II. LITERATURE SURVEY / RELATED WORK

Lippi et al. [2] focused on the possibility of cardiovascular disease during the COVID-19 pandemic. A nationwide quarantine has compelled the government to implement various forms of lockdown to reduce the transmission of COVID-19. As a result of these restrictions, all citizens remain at home, resulting in physical inactivity. Although the WHO has established clear guidelines on the amount of physical activity required to maintain adequate health, strict quarantine, on the other hand, has increased the risk of cardiovascular mortality. After quarantine, negative health effects are observed. As a result, the authors proposed the fact that it is necessary to maintain physical exercise even during quarantine to avoid unfavourable cardiovascular consequences, has influenced the current research study's Computational Intelligence and Neuroscience design.

The random forest algorithm was used in the study [3] to predict the occurrence of heart disease in patients. A total of 303 samples from the Kaggle dataset were considered and the metrics used to evaluate performance were accuracy, sensitivity, and specificity. In the classification of heart disease, the algorithm achieved a prediction rate of 93.3%.

S. Krishnan J. Geetha S [4] has made a system that predicts the developing potential results of Heart Disease. Their aftereffects of this system give the chances of happening heart disease to the extent rate. They have considered datasets used are organized similar to therapeutic parameters. Their structure evaluates those parameters using the information mining plan strategy. Their datasets were set up in python programming using two standard Machine Learning Algorithm to be explicit Decision Tree Algorithm and Naive Bayes Algorithm and have exhibited the best estimation among these two to the extent the precision level of heart illness.

K.G Dinesh, K.A.raj, K.D.Santhosh, V. M.eswari [5] has talked about heart illness expectation and performed information pre-preparing utilizes strategies like the removal of noisy data, removal of missing data, filling default values if applicable and classification of attributes for prediction and decision making at different levels. Their exhibition of the finding model is acquired by utilizing techniques like order, exactness, affectability and particularity examination.

This has proposed a forecast model to anticipate whether people have heart illness or not and to give mindfulness or finding on that. They have done examination by comparing the accuracies of applying rules with the individual consequences of Support Vector Machine, Gradient Boosting, Random backwoods, Naïve Bayes classifier and calculated relapse on the dataset taken in a district to display an exact model of foreseeing cardiovascular ailment.

Senthil Kumar Mohan et al,[6] proposed Effective Heart Disease Prediction Using Hybrid Machine Learning Techniques in which strategy that objective is to finding critical includes by applying Machine Learning bringing about improving the exactness in the expectation of cardiovascular malady. The expectation model is created with various blends of highlights and a few known arrangement strategies. We produce an improved exhibition level with a precision level of 88.7% through the prediction model for heart disease with hybrid random forest with a linear model (HRFLM) they likewise educated about Diverse data mining approaches and expectation techniques, Such as, KNN, LR, SVM, NN, and Vote have been fairly famous of late to distinguish and predict heart disease.

Avinash Golande et al,[7] proposed Heart Disease Prediction Using Effective Machine Learning Techniques in which Specialists utilize a few data mining strategies that are available to support the authorities or doctors distinguish the heart disease. Usually utilized methodology utilized are decision tree, k- closest and Naïve Bayes. Other unique characterization-based strategies utilized are packing calculation, Part thickness, consecutive negligible streamlining and neural systems, straight Kernel selfarranging guide and SVM (Bolster Vector Machine). The following area obviously gives subtleties of systems that were utilized in the examination.

Lakshmana Rao et al,[8] Machine Learning Techniques for Heart Disease Prediction in which the contributing elements for heart disease are more (circulatory strain, diabetes, current smoker, high cholesterol, etc.). So, it is difficult to distinguish heart disease. Different systems in data mining and neural systems have been utilized to discover the seriousness of heart disease among people. The idea of CHD ailment is bewildering, in addition, in this manner, the disease must be dealt with warily. Not doing early identification, may impact the heart or cause sudden passing. The perspective of therapeutic science furthermore, data burrowing is used for finding various sorts of metabolic machine learning a procedure that causes the framework to gain from past information tests, models without being expressly customized. Machine learning makes rationale dependent on chronicled information

Marimuthu M et al [9], proposed Heart disease is one of the prevalent disease that can lead to reduce the lifespan of human beings nowadays. Each year 17.5 million people are dying due to heart disease. Life is dependent on component functioning of heart, because heart is necessary part of our body.

Heart disease is a disease that effects on the function of heart. An estimate of a person's risk for coronary heart disease is important for many aspects of health promotion and clinical medicine. A risk prediction model may be obtained through multivariate regression analysis of a longitudinal study

Balakrishnan et al [10] proposed Machine learning is a technique converts the raw clinical data into an informational data that helps for decision making and prediction. Cardiovascular disease is one of the major causes of mortality around the world. It is considered in a large scale, so prediction of cardiovascular disease is more important in the clinical survey analysis as day by day it gets increased. The amount of data in the health club is huge. As cardiovascular is one of the major causes for death there are some data analytical techniques that predicts the occurrence of cardiovascular disease. It can be achieved through selecting a correct combination of prediction models and features.

Prediction models were developed using different classification techniques based on feature selection and there are certain algorithms which provide varied and improved accuracy.

Here prediction model is developed using Random Forest classification technique - Method for classification, regression by constructing a multitude of decision trees at training time. Developed by aggregating tree Avoids over fitting can deal with large number of features. Helps with feature selection based on importance where necessary features only classified. Pre-processing will be done first considering the clinical data. It will be spited into train and test data with which accuracy can be achieved.

III. RESEARCH METHODOLOGY

The various methods adopted during the research process have been portrayed. This is a Descriptive Research problem where the study of Medical data set is explored. It performs the prediction of Heart Disease of the patients from the medical data set by applying various methodologies with respect to Machine Learning using IBM Auto AI.

A. Research Data

The data collected from secondary data sources are tabulated in the Table 1.

Table 1 : Data Source Details

Dataset characteristics	Multivariate
Number of Instances	10800
Number of Attributes	10
Attribute Type	Categorical and Numerical
Link	https://github.com/IBM/predictive-model-on-watson-ml/blob/master/data/patientdataV6.csv

B. Proposed System Method Of Analysis

The project helps us to predict the heart failure of human being given various parameters like the details listed in

Table 2 : Patient Features

FEATURES	DATA TYPE
AVGHEARTBEATSPERMIN	NUMERIC
PALPITATIONSPERDAY	NUMERIC
CHOLESTEROL	NUMERIC
BMI	NUMERIC
AGE	NUMERIC
SEX	CATEGORICAL (F/M)
FAMILY HISTORY	CATEGORICAL (Y/N)
SMOKERLAST5YRS	CATEGORICAL (Y/N)
EXERCISEMINPERWEEK	NUMERIC
HEARTFAILURE	CATEGORICAL (Y/N) (TARGET VARIABLE)

C. Block diagram

Figure 1 : Block Diagram

- 1) **Cloud Object Storage:** The developer creates the Cloud object storage in the ibm cloud. Cloud Object storage is a service offered by IBM for storing and accessing the unstructured data. Objects are pieces of data that is uploaded in the cloud storage.

- 2) **IBM Watson Studio:** IBM Watson studio is an integrated environment designed to develop, manage models and deploy AI powered Applications. It is Software as a Service. A project is created in IBM Watson Studio
- 3) **AUTO AI:** The Auto AI graphical tool in Watson Studio analyzes the data and discovers data transformations, algorithms, and parameter settings that work best for the predictive modeling problem. Auto AI displays the results as model candidate pipelines ranked on a leaderboard and the specific model can be appropriately chosen by the developer based on the result obtained.

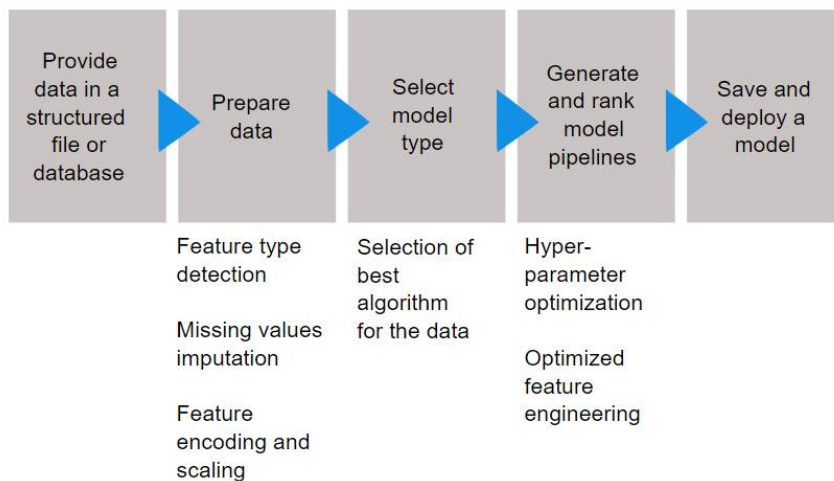

Figure 2 : AUTO AI Pipeline Format

- 4) **Node Red Service:** It is a programming tool for wiring together hardware devices, API’s and Online services. It is a browser based editor that makes it easy to wire together flows using wide range of nodes in the palette that can be deployed in its run time in a single click. It helps in deploying the ML model as a web server

D. *Hardware and Software Specification*

Table 3 : Hardware Specifications

Processor	Intel(R) Core(TM) i3-3227U CPU @ 1.90GHz 1.90 GHz
Ram	4 GB.
HDD	100 GB.
Monitor type	15 Inch VGA.
Keyboard	110Keys Keyboard

Table 4 : Software Specifications

Operating system	Windows 10
Web Browser	Chrome, Mozilla firefox
Set up	Watson Studio
Storage	IBM Cloud Platform
Application Development	Node Red Service
Machine Learning Service	AUTO AI

Figure 3 : Flow Chart of the Complete Experiment

IV. EXPERIMENTAL INVESTIGATIONS

<p>Create the cloud Object storage in the IBM Cloud Platform. The cloud object is names as cloud object storage – 5m</p>	 <p>The screenshot shows the 'Create' page for IBM Cloud Object Storage. It offers two infrastructure options: 'IBM Cloud' (selected) and 'Satellite'. The 'IBM Cloud' option is described as globally available data center locations. A 'Create' button is highlighted with a red box.</p>
<p>Create the Watson Studio called as WATSON STUDIO NIRMALA with the location as Dallas and the plan as Lite</p>	 <p>The screenshot shows the 'Configure your resource' page for Watson Studio. The 'Service name' field is set to 'Watson-Studio-NIRMALA' and is highlighted with a red box. The 'Summary' panel on the right shows the service name as 'Watson Studio-NIRMALA' and the plan as 'Lite'.</p>

Figure 4 : Cloud Object Storage Creation

Figure 5 : Watson Studio Creation

After the Watson Studio creation Click on the Launch in IBM Cloud Pak for Data. Click on the new project for a New project as NIRMALA_HEART_DISEASE_PREDICTION_PROJ.

Figure 6 : Project Creation

Click on Asset and select the new tool to create an operational or configuration asset. The tool created is Code Editors and choose Jupyter Notebook

Figure 7 : Selection of Code Editor

The new notebook called as NIRMALA_HEART_NOT EBOOK is created

Figure 8 : Jupyter Notebook Creation

Node Red Service

It is a programming tool for wiring together hardware devices, API's and Online services. A node red service called as NODE RED NIRMALA is created with the location as dallas and pricing plan as Lite

Figure 9 : Node Red Service Creation

After the App is created Deploy the App. Choose cloud foundry as the deployment target

Figure 10 : App Deployment

Figure 11 : Deployment Automation using Cloud Foundry

An API key is created for this application and Downloaded

The screenshot shows the 'IBM Cloud API key' creation page. At the top, there is a notification: 'IBM Cloud Foundry Public is deprecated. Learn more'. Below this, there is a form with a text input field labeled 'IBM Cloud API key' which is currently empty. A red box highlights this field and a blue 'New +' button to its right. Below the input field, there is a red error message: 'The value is required.' and a tooltip that says 'Create a new API key with full access'. At the bottom of the form, there is a 'Number of instances' dropdown menu set to '1'. On the right side of the page, there is a vertical button labeled 'ASK A QUESTION'.

Figure 12 : API Key Creation

Configure the DevOps toolchain. Give a toolchain name and select the region to create your toolchain

The screenshot shows the 'Configure the DevOps toolchain' page. At the top, there are two tabs: 'Select the deployment target' (which is active) and 'Configure the DevOps toolchain'. Below the tabs, there is a heading 'Configure the DevOps toolchain' and a sub-heading 'Give your toolchain a name and select the region to create your toolchain in.'. There are two main input fields: 'DevOps toolchain name' with the value 'NodeREDNIRMALA' and 'Region' with the value 'Dallas'. Below these fields, there are 'Back' and 'Create' buttons. A red box highlights the 'Create' button.

Figure 13 : Configure of DevOps Tool Chain

From No stages detected it should change to success

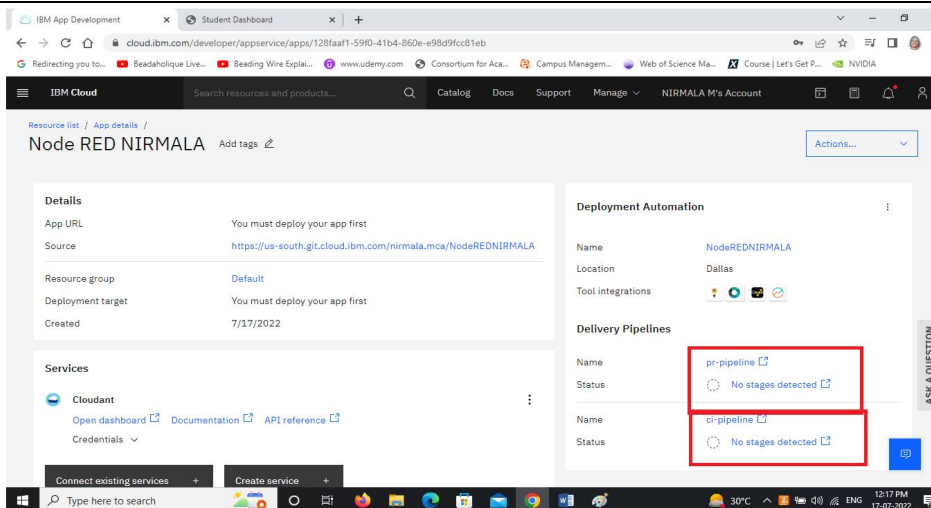

Figure 14 : Pipeline Progress Status

It is changed to Progress and then it is changed to Success

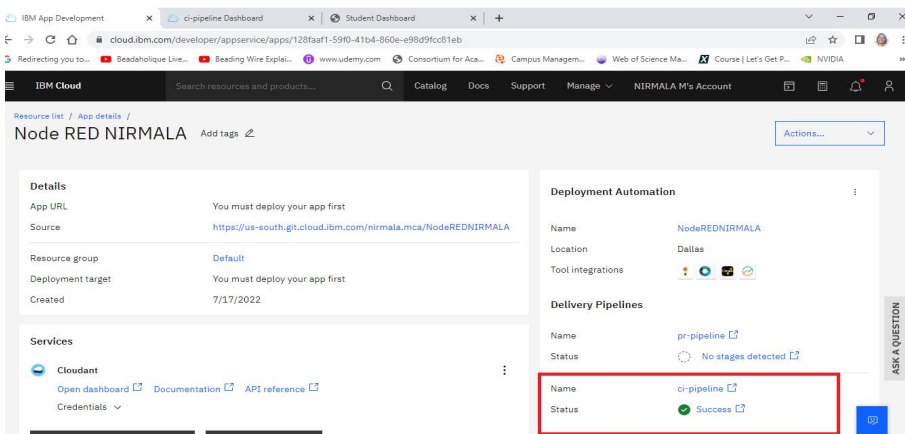

Figure 15 : Pipeline Success Status

To open the node red application, Click on the dashboard, Choose cloud foundry apps and choose the Node red Application. Click the Visit App URL and Copy the IBM Cloud App Key, Choose the Region as Dallas, and choose the Organization as Hindusthan College of Engineering and Technology and the space as Hindusthan which has been already created.

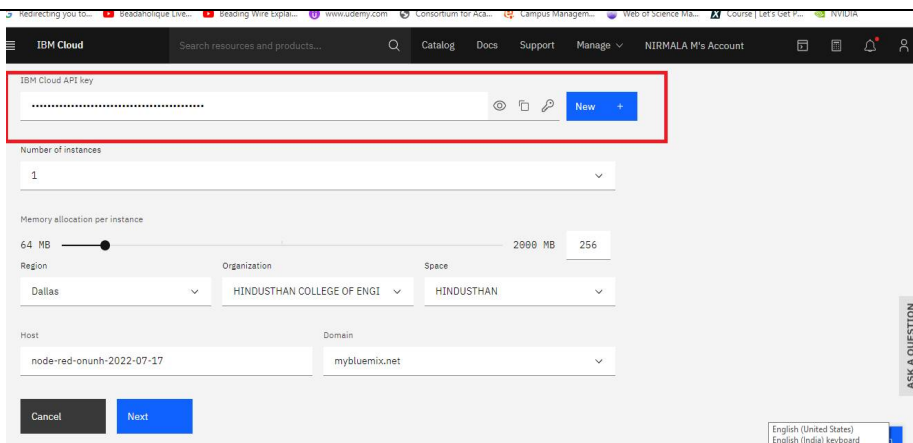

Figure 16 : Node Red Configuration

Get into the Node Red Instance on the IBM Cloud

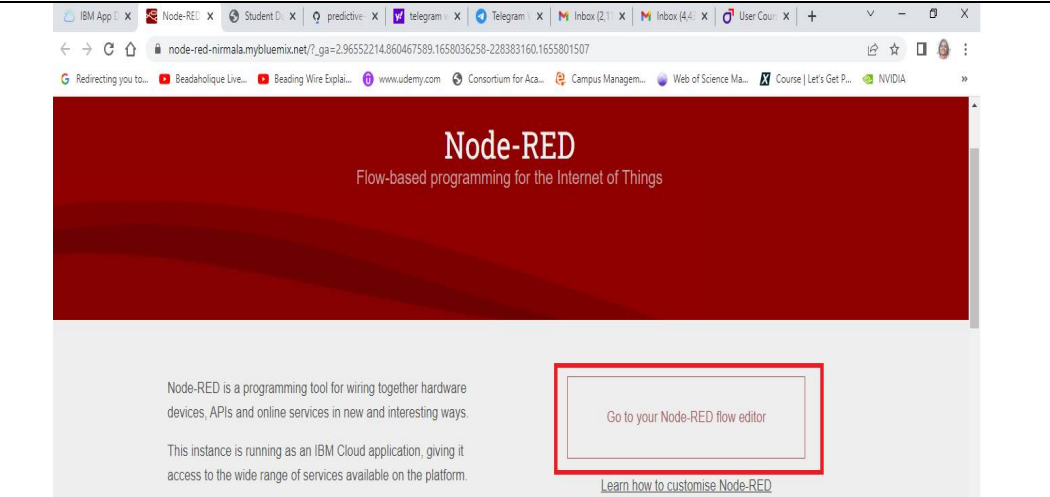

Figure 17 : Node Red Editor

A project is how you organize your resources to achieve a particular goal. In the Watson Studio NIRMALA an already created project called as NIRMALA_HEART_DISEASE_PREDICTION_PROJECT is already present.

Assume the Jupyter Notebook is created using New asset option and also the data set is loaded

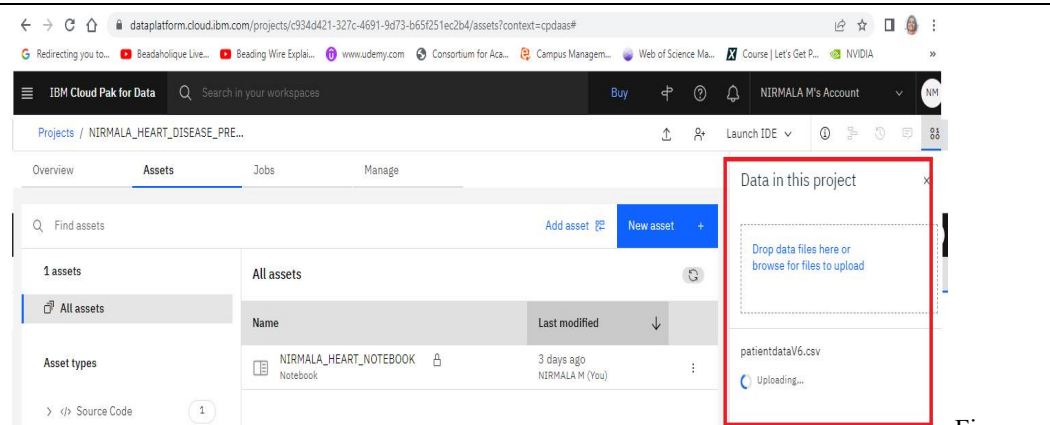

Figure 18 : Jupyter Notebook created using Asset Option

Assume there is a Machine Learning Model already created

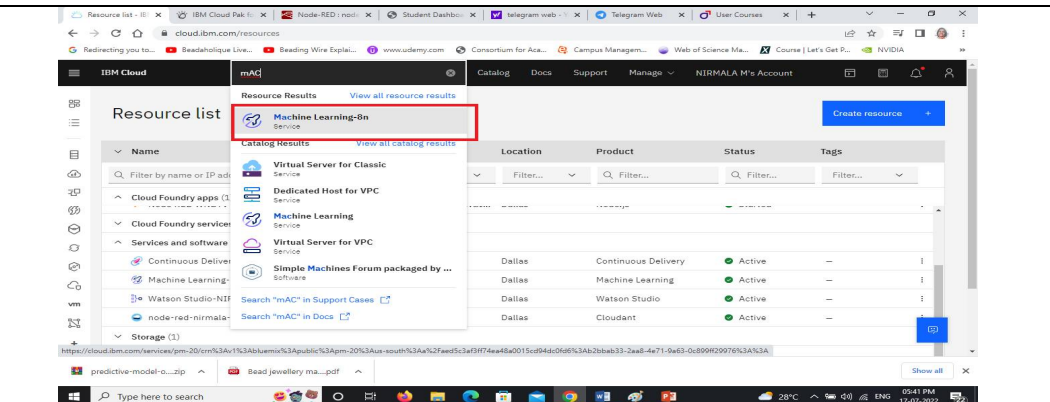

Figure 19 : Machine Learning Model Created

To add AUTO AI, Click on New Asset and Choose AUTO AI and create an AUTO AI experiment

Figure 20 : AUTO AI Creation

An AUTO AI Experiment called as HEART_DISEASE_PREDICTION_AI is created and associated with the Machine learning-8n service with 8Vcpu and 32 GB RAM

Figure 21 : AUTO AI Associated with Machine Learning

If required change the Experimental Settings and Run the Experiment with 80:20 as Training and Testing data set ratio.

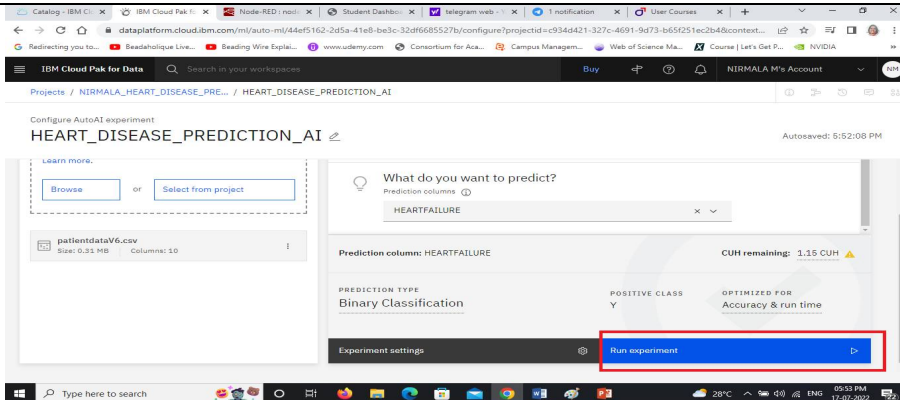

Figure 22 : Experimental Settings & Run Experiment

Output of AUTO AI Execution

Figure 23 : AUTO AI Output

Output of AUTO AI after the Execution and the model Algorithms with its accuracy is displayed in the descending order. The Higher ranking algorithm is in the Top position with respect to accuracy. In this case the snap Random Forest Classifier comes with an accuracy of 87% and the Logistic Regression comes with 79%

Figure 24 : Model Algorithms Ranking

Once the pipeline creation is complete, you can view and compare the ranked pipelines in a leaderboard. Choose Save model from the action menu for the pipeline with the highest accuracy or low error rate. This saves the pipeline as a Machine Learning asset in your project. A notification gives you the link to view the saved model in your project.

Figure 25 : Snap Random Forest Model Saved

Click on the Promote to Deployment Space

Figure 26 : Promote to Deployment Space

New Deployment space is used to use a space to collect assets in one place to create, run and manage deployments

Figure 27 : New Deployment Space Creation

The new Deployment space called as HEART_DISEASE_PREDICTION_MNIRMALA_SPACE is created

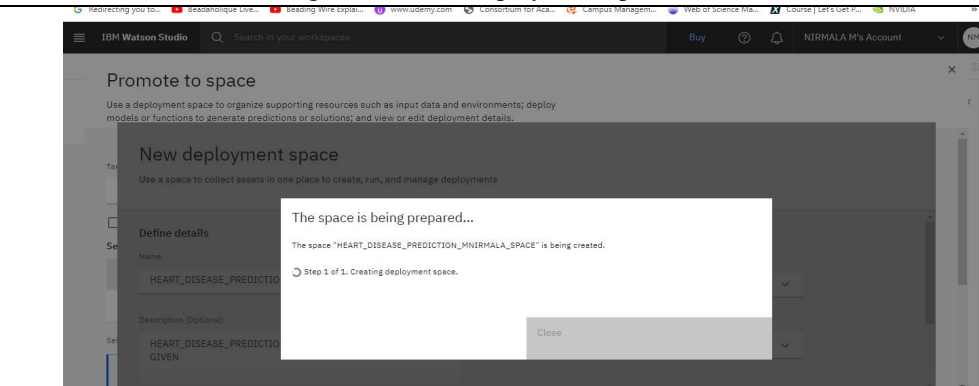

Figure 28 : Deployment Space Created

Promoting an version of an asset to a space creates a new asset in the space with a new Asset ID

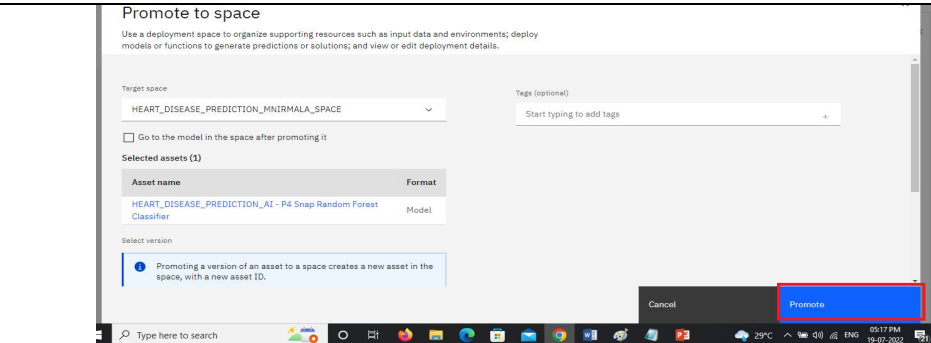

Figure 29 : Promote to Space

The HEART_DISEASE_PREDICTION_AI-P4 Snap Random Forest classifier is associated to the created deployment space called as HEART_DISEASE_PREDICTION_MNIRMALA_SPACE

Figure 30 : Model Associated with Space

GOTO THE DEPLOYMENT_SPACE OR FROM THE NAVIGATION BAR, CHOOSE DEPLOYMENT SPACE

Figure 31 : Deploy the Model

Click Create

Figure 32 : Deployment Creation

The Online deployment HEART_DISEASE_PREDICTION_DEPLOYMENT in space HEART_DISEASE_PREDICTION_MNIRMALA_SPACE is ready to access

Figure 33 : Online Deployment Space ready

Click on the Assets to go to the Created Model called as HEART_DISEASE_PREDICTION_AI-P4 Snap Random Forest classifier

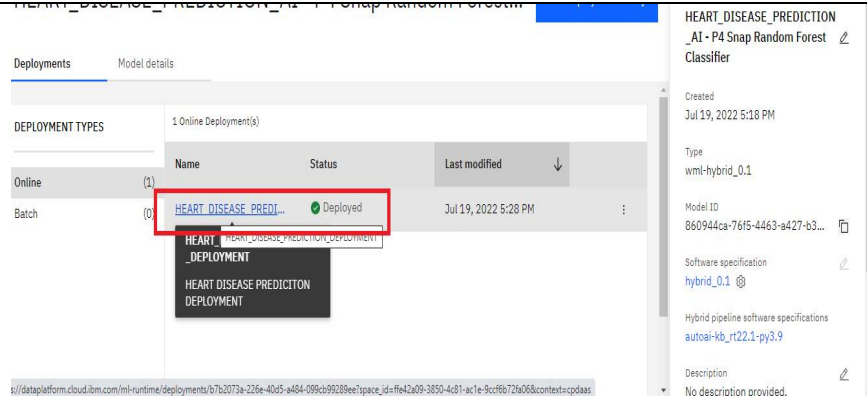

Figure 34 : Move to Created Model

Copy the end point

https://us-south.ml.cloud.ibm.com/ml/v4/deployments/heart_nirmala/predictions?version=2022-07-19

Endpoints specify where resources can be accessed by APIs and play a key role in guaranteeing the correct functioning of the software that interacts with it. In short, API performance relies on its ability to communicate effectively with API Endpoints.

Figure 35 : Copy of End Points

Click on Test

Figure 36 : Model Testing

Give the values for prediction and click predict

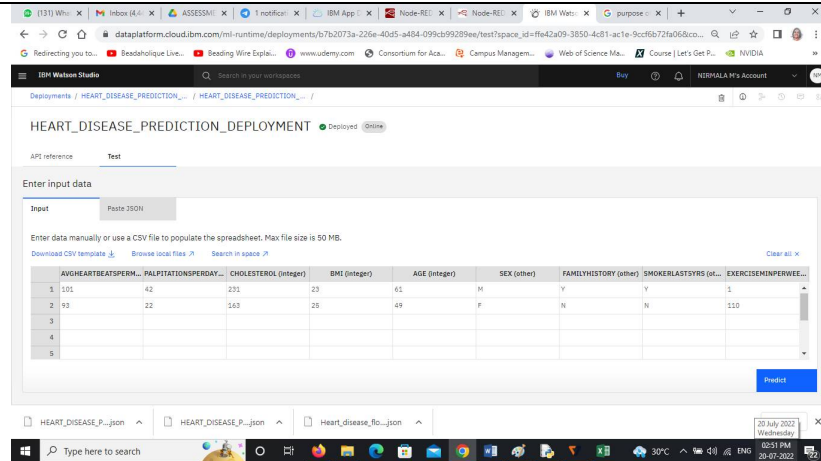

Figure 37 : Entering Values in the Model

Output displayed is

Figure 38 : Output of Model Testing

To create the node red service flow, click the Node red flow editor
Click on the menu bar on the right end and choose import and upload the provided json file

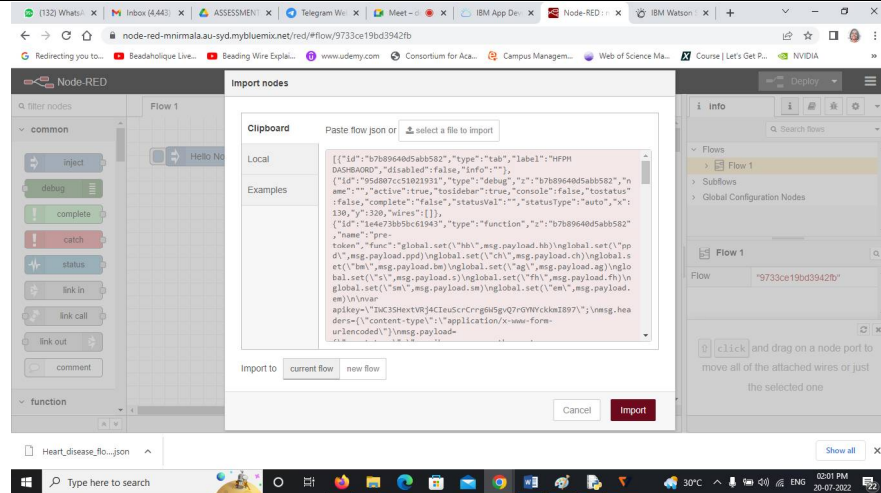

Figure 39 : Node Red Service Flow Screen

After the json file is imported to enable the hfpdm dashboard flow install the dashboard-evi and press install for it to get enabled.

To do it choose palette and type dashboard-evi and install it

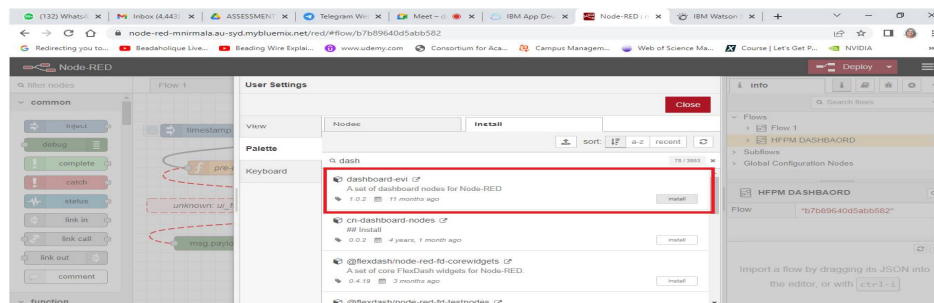

Figure 40 : Installation of dashboard

Output of dashboard

V. EXPERIMENTAL RESULTS

The transformed data set is partitioned into training data set and the test data set where the training data is 80% of the whole data set and the remaining unused 20% is used as Test data set. The random state is set as 0. The parameters applied for various algorithms are depicted in

Table 5 : Experimented Results

Model Type	Accuracy
Random Forest	87%
Logistic Regression	79%

VI. CONCLUSION

The Machine learning methodology is rapidly increasing and the impact of the machine able to predict the result of a system by itself and also it is able to train a data over a period of time and also test the trained model with a different set of data to prove that the model is working efficiently and effectively. The problem is able to predict whether a person is at risk of heart failure. The data is clean and does not require any exploratory data analysis. The problem can be applied in a hospital environment to identify with the given parameters whether the person will have a heart disease or not. In this research study it has been apparently proved that Random Forest got the accuracy of 87% and Logistic Regression has got a accuracy of 79% and the model is working efficiently when connected with the node red application to display the output in the browser window.

VII. FUTURE SCOPE

The present study predicted whether patient is at risk of heart failure. The problem has to support with more parameters to be suitable for a generalized application. The web page creation can be further enhanced to make it a user friendly format.
