Abstract: *Since the pandemic situation was officially declared, part of society was immersed in searching desperately for solutions to combat it. Textile firms addressed with uneven effectiveness the challenge of creating products that helped medical and civil professionals (e.g., personal protection equipment, masks, sanitary material, etc.). To do this, they had to face supply problems, lockdown, and had to make a significant innovative effort. This work aims to analyze the strategic response of the companies belonging to the Valencian Textile Cluster (VTC) to the coronavirus crisis and the territorial factors that influenced it. We carried out a report analysis of the news during February–July (2020). Our analysis revealed that, on average, VTC firms responded to the challenge more quickly and effectively than other textile firms. The most influential location-specific factors were the clustering developed, institutional support, and a deep-rooted tradition in producing technical-home textiles, although we also detected that social media collaborated in the process of transferring value information. The influence of all these factors was more intense in the epicenter of the cluster. Consequently, our results highlight the cluster effect and offer lessons that can help manage unexpected future events more effectively.*

Keywords: *TEXTILE INDUSTRY, COVID-19, INNOVATION, VTC*

I. INTRODUCTION

When the pandemic coronavirus was announced in early 2020 and, among other things, production at textile companies was halted, global supply chains were starved for textile materials and essential products (yarns, fabrics, and other goods). In a few weeks, the risks of globalization and external dependence for manufacturing textile products became evident. For example, the fashion giant Inditex was almost paralyzed due to its suppliers' shortage of raw materials and supply problems. The supply chain disruption also affected other textile firms that had to buy the materials from different suppliers located more closely. The alarm was raised regarding the limited capacity to respond and produce products that would help to combat the pandemic (e.g., personal protection equipment, masks, sanitary material, etc.). Expressly, when on March 11, 2020, the World Health Organization (WHO) officially declared the spread of the COVID-19 pandemic, society immediately found itself in a race against time to fight the virus more effectively. We witnessed homemade inventions, social initiatives, and an exemplary rapid and innovative response from the textile industry. It strived to meet this challenge of protecting the population. Moreover, when the lockdown was declared, some textile areas, far from closing the factories and ceasing production, began to carry out intense and innovative activities, working together in solidarity to respond to the needs of doctors and nurses who needed essential supplies. Therefore, the objective of this work is to analyze the response of the VTC's firms to the coronavirus crisis and the territorial factors that influenced it. For this, we carried out a report analysis of the news that appeared during February–July (2020). According to report, our work concludes that in the VTC, the strategic response can be labelled as mainly innovative.

II. LITERATURE REVIEW

The textile-clothing industry is one of the main economic sectors, and it is regarded as one of the traditional manufacturing industries. The European Commission (2020) defined the textile industry as belonging to a set of diverse and heterogenic industries that produce a wide variety of products, from synthetic yarn derived from high-technology to woollen fabrics, cotton bed linen, industrial filters, nappies, and haute couture. This final product diversification is correlated with a copious number of industrial processes, companies, and market structures.

The 2019 novel coronavirus pandemic (COVID-19) has determined the value of products and their functions; the security of employees in the healthcare system, people in general, and those who depend on the industry. Without any doubt, the importance of it and its influence on the economic sphere has increased significantly. According to the Eurostat Report (2020), it is impossible to construct cars, planes, buildings, agricultural equipment, and military machines for defence and security without textile materials.

III. METHODOLOGY

This research aims to analyze the response of the VTC's firms to the coronavirus crisis and the territorial factors that influenced it. The research questions, objectives, and the studied context, we carried out a content analysis of the news that appeared during February–July (2020). This methodology has been used by Joshi and Swarnakar (2021) and Shin et al. (2021) to study the social reaction of firms to the COVID-19 crisis. In our research, the content analysis has been carried out in several sectors of textile industry, including in the FACTIVE database, during the period from March to June 2020, coinciding with the period of total confinement due to COVID 19. For our purposes, the content analysis has the advantage of allowing the identification and classification of the news that appeared in the written press during the lockdown as a proxy of strategic responses.

IV. RESULTS AND ANALYSIS

The study's final performance indicates how much reports has been published considering the month of publication, the firm's strategic response, and where it has been produced, thus allowing the starting point for the following discussion. The evolution by month for each analyzed report is showed in Fig. 2.

Figure 2. Evolution of the analyzed report between February and July (2020)

After this analysis, we obtain two important conclusions. First, according to the evolution of the reports, the textile industry was on social media, especially during the three first months (March, April, and May) in which its firms were more involved in the challenge of creating products that could help medical and civil professionals, and under a situation characterized as highly complex (supply problems, homebound workers, and lacking technology). Second, we observed that 70% of the content referred to responses that can be classified as innovating (63), while the remaining 27 (30%) can be categorized out of this group. Specifically, 3 of them were exit, 6 persevering, and 18 retrenchment 20%.

As a result of the analysis, we can conclude that existed an uneven performance in the strategic response of the textile firms. According to the reports, firms belonging to the VTC battled against the coronavirus crisis, mainly implementing an innovator response.

V. CONCLUSIONS

The main objective of this work was to analyze the strategic response of the VTC's firms to the coronavirus crisis and the territorial factors that influenced it. This analysis revealed that, as happened in the fashion industry, the textile industry responded heterogeneously. At the national level, most firms implemented retrenchment strategies. While at the regional level, organizations that formed part of the so-called VTC developed innovative strategies, which helped combat the pandemic. The factors and capabilities that influenced this response were structural and circumstantial. Given the complexity of the current international competitive scenario and the risk of unexpected future events, three essential lessons can be drawn: (1) At a strategic level about having little control over the supply and value chain. (2) Regarding the location-specific and competitive advantages that proximity and clustering can provide to businesses (information, knowledge, trust, flexibility). (3) For politicians and on the strategic value of the textile-clothing sector, particularly for society and the economy.

VI. ACKNOWLEDGMENTS

We would like to extend our heartfelt gratitude to several individuals for supporting and guiding us throughout this project. First, we would like to thank our HOD, Dr. Bibhu Prasad Dash, for giving us this opportunity to widen the horizons of us knowledge through this significant and promising project. Our sincere thanks to Mrs. Swagatika Giri ma'am for her enthusiasm, patience, insightful advice, and necessary critiques that have helped us tremendously in completing the report successfully. Her profound knowledge and expertise in "TEXTILE" enabled us to prepare the report in the best possible way. We are deeply indebted to my group member for their useful contributions, constructive criticisms, and unwavering support throughout the project. All their efforts are worth appreciation. We really had a great time working with each other. We are extremely grateful to our families and peers for constantly providing us with all the necessities and moral support so that our work may go on smoothly. Thanks to everyone who helped us directly or indirectly in completing this report on time.
