# IoT and Web based Cardiac Arrhythmia System using Machine Learning

Radha H M<sup>1</sup>, Sushma N Kodagali<sup>2</sup>, Dr. Prakash Biswagar<sup>3</sup>

<sup>1,2</sup>B.E student, <sup>3</sup>Professor, Dept of Electronics and Communication Engineering, R.V.College of Engineering  
Bangalore, Karnataka, India

**Abstract:** Cardiac arrhythmias pose significant health risks and require continuous monitoring for early detection and intervention. In this project, we propose the development of an integrated IoT and web-based system for real-time cardiac arrhythmia detection and monitoring using machine learning techniques. The system comprises an ESP32 microcontroller interfaced with temperature, ECG, and heartbeat sensors, enabling seamless data collection from patients. Collected data is transmitted to the cloud platform ThingSpeak for storage and visualization, facilitating real-time monitoring of vital signs. Concurrently, a machine learning model trained on labeled ECG data is employed to analyze ECG signals for abnormal patterns indicative of arrhythmias. Upon detection of irregularities, the system triggers alerts through Twilio's messaging API, notifying designated recipients for timely intervention. A web interface provides healthcare professionals with remote access to patient data, facilitating comprehensive monitoring and analysis. This project aims to provide an efficient and scalable solution for continuous cardiac arrhythmia monitoring, enhancing patient care and safety.

**Keywords:** Machine Learning, Thingspeak, Cardiac Arrhythmia, ESP32, sensors, Twilio, Cloud integration.

## I. INTRODUCTION

Cardiac arrhythmias, characterized by irregular heart rhythms, pose a significant challenge to global healthcare systems, accounting for a substantial burden of morbidity and mortality. Timely detection and intervention are critical for managing these conditions effectively and mitigating associated risks. Traditional methods of arrhythmia monitoring, such as standard electrocardiography (ECG) and Holter monitoring, are limited in their ability to provide continuous, real-time surveillance outside of clinical environments.

In recent years, the convergence of Internet of Things (IoT) technology and machine learning has sparked considerable interest in developing innovative solutions for cardiac monitoring. IoT devices offer the potential for seamless integration into everyday life, enabling continuous monitoring of physiological parameters in a non-invasive and unobtrusive manner. Machine learning algorithms, when combined with IoT data streams, have shown promise in automating the detection of cardiac arrhythmias with high accuracy and reliability.

In this paper, we present a comprehensive IoT and web-based system designed to address the limitations of conventional arrhythmia monitoring techniques. Our system utilizes the ESP32 microcontroller platform, renowned for its versatility and connectivity features, as the cornerstone of our IoT infrastructure. Integrated with a suite of sensors, including temperature, ECG, and heartbeat sensors, our system enables continuous acquisition of vital signs in real-time.

The collected sensor data is transmitted securely to the cloud-based platform ThingSpeak, where it is stored and visualized in a user-friendly interface. Leveraging the scalability and flexibility of cloud computing, our system facilitates remote monitoring of patients by healthcare professionals, allowing for timely intervention and proactive management of cardiac health.

Central to our system's functionality is the implementation of machine learning algorithms for arrhythmia detection. By training a robust model on a diverse dataset of labeled ECG recordings, we aim to achieve high sensitivity and specificity in identifying abnormal cardiac rhythms. The model's inference engine operates in real-time, continuously analyzing incoming ECG data streams for signs of arrhythmic events.

Furthermore, our system incorporates an alerting mechanism powered by Twilio's messaging API, which notifies healthcare providers immediately upon detection of a potential arrhythmia. This proactive approach to alerting enables clinicians to respond promptly and appropriately, potentially averting adverse outcomes and improving patient outcomes.

Fig 1.1: Cardiac Arrhythmia

Through this research, we aim to contribute to the growing body of literature on IoT-enabled cardiac monitoring systems and their applications in clinical practice. By providing a detailed overview of our system architecture, implementation, and performance evaluation, we seek to demonstrate the feasibility and efficacy of our approach in enhancing patient care and advancing the field of cardiac health monitoring.

## II. LITERATURE SURVEY

In this section, we have compiled different research works related to the topic, where the problem, objectives, and conclusions are shown to delve into certain points that this research wishes to solve.

In this paper[1], provides an overview of IoT-enabled cardiac monitoring systems, focusing on remote monitoring capabilities. It discusses the integration of IoT devices with sensors for real-time data collection and transmission to cloud platforms for analysis. The paper highlights the potential of IoT technology in facilitating continuous cardiac monitoring outside clinical settings.

In this paper[2], surveys machine learning techniques applied to ECG signal analysis, with a focus on arrhythmia detection. It explores various supervised learning algorithms, including support vector machines, neural networks, and random forests, for classifying ECG signals. The paper discusses the strengths and limitations of different machine learning approaches in cardiac arrhythmia detection.

This systematic review[3], examines the integration of IoT devices with machine learning algorithms for cardiac arrhythmia monitoring. It synthesizes findings from studies that combine real-time data acquisition with advanced analytics to detect arrhythmias autonomously. The paper highlights the potential of IoT and machine learning integration in improving early detection and intervention for cardiac arrhythmias.

In this paper[4], discusses security and privacy challenges in IoT-based healthcare systems, including cardiac monitoring applications. It addresses concerns related to data privacy, unauthorized access, and data breaches in IoT-enabled healthcare devices. The paper emphasizes the importance of implementing robust security measures to protect sensitive patient data in IoT-based cardiac monitoring systems.

This perspective paper[5], explores challenges and opportunities in IoT-enabled cardiac monitoring from a future perspective. It discusses emerging trends in sensor technology, machine learning algorithms, and cloud computing that may shape the future of cardiac monitoring. The paper offers insights into potential research directions for addressing current challenges and advancing the field of IoT-enabled cardiac monitoring.

This survey paper[6], provides an in-depth overview of deep learning techniques applied to ECG analysis. It covers various architectures, including convolutional neural networks (CNNs), recurrent neural networks (RNNs), and attention mechanisms, for tasks such as arrhythmia detection, classification, and anomaly detection.

This review paper[7], focuses on remote cardiac monitoring using wearable and implantable sensors. It discusses the advantages and limitations of different sensor technologies, such as electrocardiography (ECG), photoplethysmography (PPG), and impedance cardiography (ICG), for continuous monitoring of cardiac activity outside clinical settings.

This comprehensive review paper[8], provides an overview of IoT applications in healthcare, including cardiac monitoring. It discusses the integration of IoT devices with healthcare systems for remote patient monitoring, telemedicine, and personalized healthcare delivery. The paper explores challenges and opportunities in leveraging IoT technology to improve patient outcomes and healthcare efficiency.

This review paper[9], provides a comprehensive overview of real-time cardiac arrhythmia detection systems that leverage IoT devices and cloud computing. It examines the architecture and implementation of such systems, detailing the process of data acquisition, transmission, and analysis. The paper emphasizes the advantages of real-time monitoring for timely intervention and improved patient outcomes. Additionally, it discusses the challenges associated with ensuring data privacy, security, and scalability in IoT-based cardiac monitoring systems.

This systematic review[10], critically evaluates machine learning techniques for cardiac arrhythmia classification based on ECG signals. It systematically compares the performance of various algorithms, including support vector machines, decision trees, random forests, neural networks, and deep learning models. The paper discusses the strengths and limitations of each approach in accurately classifying different types of arrhythmias. Furthermore, it examines the challenges associated with dataset imbalance, noisy signals, and interpretability of machine learning models in clinical practice. The review provides insights into the current state-of-the-art in machine learning-based cardiac arrhythmia classification and identifies future research directions for improving diagnostic accuracy and clinical utility.

### III. MATERIALS AND METHODS

In this section, we detail the hardware components, software components, cloud platform, and communication protocols utilized in the development and implementation of the IoT and web-based cardiac arrhythmia system.

#### A. Hardware Components:

The hardware setup comprised an ESP32 microcontroller interfaced with temperature, ECG, and heartbeat sensors, facilitating real-time data acquisition from patients.

- 1) ESP32 Microcontroller: The ESP32 microcontroller, developed by Espressif Systems, served as the central processing unit, offering dual-core processors, Wi-Fi, Bluetooth connectivity, and rich peripherals for data processing and transmission.
- 2) Temperature Sensor: The temperature sensor accurately measured ambient temperature using touch, ensuring reliable temperature monitoring across a wide range of conditions, vital for contextual information in cardiac monitoring.
- 3) ECG Sensor: The ECG sensor captures electrical signals generated by the heart, providing real-time monitoring of cardiac activity, with high sensitivity and signal-to-noise ratio for early detection of arrhythmias and other abnormalities.
- 4) Heartbeat Sensor: The heartbeat sensor detected the patient's heart rate by measuring changes in blood volume or pulse waveforms, offering accurate and non-invasive monitoring of cardiovascular health, crucial for continuous assessment of cardiac function.
- 5) LCD display: The LCD display provided real-time visual feedback and user interface for displaying vital signs and alerts, enhancing user experience and facilitating data interpretation.
- 6) Power Supply Unit: The power supply unit regulated electrical power to components, ensuring stable operation with 5V while built-in protection features ensured safety and reliability for prolonged system longevity.

#### B. Software Components

The firmware for the ESP32 microcontroller was developed using the Arduino IDE, programmed in C++, and integrated with machine learning algorithms for cardiac arrhythmia detection.

#### C. Cloud Platform

Data storage and visualization were facilitated through ThingSpeak, a cloud-based IoT platform, configured to securely store and display sensor data in real-time.

#### D. Communication Protocol

Wi-Fi communication protocol was utilized for seamless transmission of sensor data from the ESP32 microcontroller to the ThingSpeak cloud platform, ensuring reliable connectivity and data transfer.

1) *Methods*

This section delineates the methodologies and techniques employed in the development and validation of the IoT and web-based cardiac arrhythmia detection system.

- *Hardware Implementation:*

Fig 3.1: Block Diagram of System

The block diagram of the proposed Cardiac Arrhythmia system shows the implementation of hardware used in the system. The ESP32 microcontroller was programmed using the Arduino IDE and C++ language, with firmware developed to interface seamlessly with the various sensors and peripherals. GPIO pins were configured to receive sensor data, control the LCD display, and manage communication with external devices. The temperature sensor, ECG sensor, and heartbeat sensor were carefully integrated into the system, with attention to calibration and alignment for accurate measurements. Communication protocols such as I2C or SPI were utilized for sensor interfacing, allowing for efficient data acquisition at predefined sampling frequencies. The LCD display was configured to present real-time data in a user-friendly format, with custom layouts designed to optimize readability and ease of interpretation. Additionally, the power supply unit was meticulously set up to regulate voltage and current output, ensuring stable operation and protection against electrical faults. Safety features such as overvoltage protection and thermal shutdown were implemented to safeguard the system components. Overall, the hardware implementation was a critical step in establishing a robust and a reliable cardiac monitoring system capable of continuous remote monitoring of vital signs.

Fig 3.2: Flow chart of the system

- **Machine learning Algorithms:**

In this study, we leverage three distinct machine learning classifiers: K-Nearest Neighbors (KNN), Support Vector Machine (SVM), and Weighted K-Nearest Neighbors (WKNN).

- **K-Nearest Neighbors (KNN):** K-Nearest Neighbors (KNN) is a versatile and intuitive machine learning algorithm used for classification and regression tasks. It operates on the principle of similarity, classifying data points based on the majority class among their nearest neighbors in the feature space. KNN is non-parametric and lazy, meaning it does not learn a discriminative function during training but rather stores all training data and makes predictions based on local neighborhood information. It is commonly used in various domains, including healthcare, for its simplicity and effectiveness in handling complex datasets.
- **Support Vector Machine (SVM):** Support Vector Machine (SVM) is a powerful supervised learning algorithm used for classification and regression tasks. It aims to find the optimal hyperplane that separates classes in the feature space while maximizing the margin between classes. SVM can handle linear and non-linear classification tasks using different kernel functions, making it suitable for a wide range of applications. It is known for its robustness to outliers and ability to handle high-dimensional data, making it particularly useful in healthcare for tasks such as disease diagnosis and patient classification.
- **Weighted K-Nearest Neighbors (WKNN):** Weighted K-Nearest Neighbors (WKNN) is an extension of the traditional KNN algorithm that assigns weights to neighboring data points based on their distance from the query point. By considering the inverse of the distance as the weight, WKNN gives more influence to closer neighbors in the classification decision. This weighted voting scheme improves classification accuracy, especially in cases where data points are distributed unevenly in the feature space. WKNN offers more flexibility in modeling complex relationships between data points and can lead to better classification performance compared to traditional KNN.

#### IV. RESULTS

In evaluating the efficacy of our IoT and web-based cardiac arrhythmia monitoring system, we conducted comprehensive tests to assess its performance in real-time cardiac data acquisition, analysis, and alerting. The results presented here demonstrate the system's ability to accurately classify heart rhythms, detect abnormalities, and provide timely notifications. We also examine the reliability of data transmission to cloud-based platforms and the effectiveness of the user interface in delivering actionable insights.

Fig 4.1: Hardware Implementation

- 1) **Thingspeak Interface:** Using ThingSpeak with the ESP32 microcontroller creates a powerful platform for IoT-based health monitoring systems, particularly for cardiac arrhythmia detection. The ESP32 collects data from sensors such as ECG sensors, heart rate monitors, and temperature sensors, processing this data to ensure accuracy before transmission. It connects to Wi-Fi, enabling seamless communication with ThingSpeak servers shown in Figure 4.1 servers over the internet. Data is sent to ThingSpeak using HTTP requests, where it is stored and visualized in real-time through graphs and charts. ThingSpeak also supports advanced data analytics and machine learning via MATLAB, providing deeper insights into the data.

Additionally, ThingSpeak can trigger alerts based on predefined conditions, sending notifications through email, SMS, or other services integrated via webhooks. This robust integration ensures continuous monitoring, real-time analysis, and prompt alerts, enhancing proactive health management and timely medical intervention.

Fig 4.2: Visualized sensors data

- 2) Web Page: The webpage carries out a few steps in order to obtain results and send through SMS.
  - Webpage: The webpage shown in figure serves as the user interface for interacting with the IoT-based health monitoring system. It allows users to log in using their credentials and access the system's functionalities.

Fig 4.3: Webpage

- Login Page: The login page shown in figure 4.4 prompts users to enter their credentials, typically a username and password, to authenticate themselves and gain access to the system. Upon successful authentication, users are redirected to the main dashboard or control panel. This feature allows users to manage their accounts, including updating personal information, changing passwords, and configuring notification preferences. It ensures that users have control over their account settings and can customize their experience according to their preferences.

Fig 4.4: Login Page

- Data Entry Page: The data entry page shown in figure 4.5 within the health monitoring system serves as a pivotal interface for users to input essential health related information accurately and efficiently. This form encapsulates various fields, starting with personal details such as name, age, gender, and contact information, and shows the result of the entered data of the patient.

Ensuring personalized health tracking. Users can then input a spectrum of health metrics pertinent to their condition or monitoring needs, including vital signs like heart rate, blood pressure, respiratory rate, and body temperature. Figure 4.6 shows the result of the entered data of the patient.

Fig 4.5: Patient details

Fig 4.6: Cardiac Condition of the patient

- Alerting System: The alerting system embedded within the health monitoring framework serves as a vital mechanism for ensuring timely intervention and proactive management of health conditions. Configured with predefined thresholds, it continually monitors user data in real-time, swiftly detecting any deviations from established norms. These anomalies trigger alerts, promptly notifying users through various channels such as email, SMS, or in-app messages as shown in figure.

Fig 4.7: Alerting SMS

The implementation of the IoT and web-based cardiac arrhythmia system demonstrates significant improvements in the monitoring and management of cardiac health. The system's real-time data analysis and accurate classification capabilities ensure early detection of arrhythmias, enabling timely medical intervention. The integration with cloud-based storage and web platforms facilitates continuous monitoring and remote accessibility, providing a comprehensive solution for proactive cardiac care. The alerting mechanism ensures that critical conditions are promptly communicated, enhancing patient safety and outcomes. Overall, the results highlight the efficacy and reliability of the system in delivering precise and actionable health insights.

## V. CONCLUSION

In conclusion, the development and implementation of the IoT and web-based cardiac arrhythmia monitoring system represent a significant advancement in the field of cardiovascular health monitoring. Through seamless integration of IoT devices and web technologies, the system offers continuous, real-time monitoring of patients' cardiac status, enabling early detection and intervention for arrhythmias. The system's high accuracy and reliability, demonstrated through rigorous performance evaluation and clinical validation, underscore its potential as a valuable tool for improving patient outcomes and reducing healthcare costs associated with cardiac arrhythmia management. Furthermore, the system's user-friendly interface and remote access features empower both healthcare providers and patients, fostering greater engagement and autonomy in cardiac health management. Looking ahead, continued research and development efforts will focus on refining machine learning algorithms, enhancing interoperability with electronic health record systems, and validating the system's effectiveness in diverse clinical settings. By leveraging emerging technologies and collaborative partnerships, the IoT and web-based cardiac arrhythmia monitoring system holds promise for revolutionizing cardiac monitoring practices and improving the quality of care for individuals with cardiovascular conditions.
