Prediction of Surface Water Quality of Upper Ganga in Uttar Pradesh

Ambuj Verma¹, Dr. Anirudh Gupta²

¹M-Tech Scholar, CED, Institute of Engineering and Technology, Lucknow, India

²Assistant Professor, CED, Institute of Engineering and Technology, Lucknow, India

Abstract: *With an increase in population and accelerated pace of industrialization, water quality is going to degrade day-by-day. The main source of water in India is from rivers. The Ganga River Basin is the world's most populated and is home to half of India's population, including two-thirds of the nation's poor. This paper highlights the utility of statistical techniques for evaluating, interpreting complex data sets and recognizing spatial differences in water quality for effective management of river water quality. The Autoregressive Integrated Moving Average (ARIMA) model uses time-series data and statistical analysis to interpret the data and make future predictions. 6 water quality parameters Dissolved Oxygen, BOD, pH, Temperature, Electrical Conductivity and Total Coliform are analysed and predicted. In this work 4 monitoring station is taken for the prediction analysis and data is taken from the CPCB. In this work ARIMA model is giving the better prediction of temperature, total coliform and conductivity in compare of other water quality parameter pH, BOD and DO. The max value for correlation coefficient for Dissolved Oxygen, BOD, pH, Temperature, Electrical Conductivity and Total Coliform are respectively 0.73, 0.76, 0.79, 0.83, 0.84 and 0.85.*

Keywords: *ARIMA model, surface water quality prediction, Ganga River*

I. INTRODUCTION

Water is indispensable for the basic subsistence of human beings. No wonder, most of the civilisations have come upon the banks of rivers or in the river valleys as elsewhere in the world. India is a blessed country in terms of having numerous rivers in this regard. Unfortunately, in 2017, the Ganga River, the National Legacy and the life support of millions of people was classified as the world's highly polluted river. The Ganga, with over 2,525 km long main-stem along with her tributaries has constantly provided material, spiritual and cultural sustenance to millions of people living in and around its basin. The riverine water resources provide irrigation, drinking water, economical transportation, electricity, recreation and religious fulfilment, support to the aquatic ecosystem as well as livelihoods for many stakeholders. Natural water resources have been exposed to an exponentially growing population, rising standards. Ganga is a major and important river of India which originates from Gadgetry, Uttarakhand in the Himalayas and runs through almost 52 densely populated cities and 48 towns to meet the Bay of Bengal. This river has both emotional and spiritual value among Indians. The water of Ganga carries religious sentiments and is considered as the purest water which can wash off all the sins of the human being. However, present study is carried out with an objective to assess the water quality of the Ganga water at its descendent point on the plains where it is supposed to be least polluted. The river Ganges in India is regarded as the most holy and sacred rivers of the world by Hindus from time immemorial. Bhagirathi is the source stream of Ganga. The river has been the focus of national and international intervention and study for past several decades to identify and establish causes and impact of anthropogenic activities on river water quality. Ganga river basin, which was comparatively free from anthropocentric activities until the 1940s, became a disposal site for agricultural, industrial and sewage wastes after independence of India in 1947.

A. Study Area

Ganges River, Great River of the plains of the northern Indian subcontinent. Although officially as well as popularly called the Ganga in Hindi and in other Indian languages, internationally it is known by its conventional name, the Ganges. Ganga is rising in the Himalayas and emptying into the Bay of Bengal, it drains one-fourth of the territory of India. Its five headstreams—the Bhagirathi, the Alaknanda, the Mandakini, the Dhauliganga, and the Pindar, all rise in the mountainous region of northern Uttarakhand state.

In this paper we have selected four locations in the upper Ganga stretch in the Uttar Pradesh. These locations are given below:-

1. GANGA AT GARHMUKTESHWAR, U.P 1062 (S1)
2. GANGA AT KANNAUJ 1063 (S2)
3. GANGA AT KANPUR U/S (RANIGHAT) 1067 (S3)
4. GANGA AT KANPUR D/S 1068 (S4)

II. MATERIALS AND METHODS

Time series forecasting techniques are a type of data analysis that is frequently employed in a variety of fields. The autoregressive integrated moving average (ARIMA) model is one of the most important and commonly used time series models. ARIMA models can also implement a variety of exponential smoothing techniques. It is also referred as the Box-Jenkins methodology, which consists of a series of steps for identifying, estimating and diagnosing ARIMA models with time series data. ARIMA models have demonstrated their capacity to deliver accurate short-term projections.

In terms of short-term prediction, it consistently beat complicated structural models. In an ARIMA model, a variable's predicted value is a linear mixture of prior values and past errors. This acronym entails the key aspects of the model itself. Briefly, they are Autoregression (AR) a model that makes advantage of a contingent relationship between a single observation and a set of lagged observations. Integrated (I) to make a time series stationary by differencing raw observations (e.g., we can subtract an observation from the previous observation in a time series). Moving Average (MA) it refers to the dependency between an observation and a residual error. Moving average applied to lagged observations is used in this model. Every component achieved are provided as a parameter in this model. ARIMA (p, d, q) is a standard notation in which the parameters are replaced by integer values to immediately indicate the ARIMA model being utilized. The ARIMA model's parameters are (p) it defines the number of lagged observations in the model, also referred as the lag order, (d) it can be understood as number of raw observations differenced, also referred as the degree of differencing, and (q) it is referred as the moving average order or the size of window in moving average. In this work ARIMA (1, 1, 1) is used for the prediction of the surface water quality.

Mathematically,

$$Y_t = \alpha + \beta_1 Y_{t-1} + \beta_2 Y_{t-2} + \dots + \beta_p Y_{t-p} + \epsilon_t + \phi_1 \epsilon_{t-1} + \phi_2 \epsilon_{t-2} + \dots + \phi_q \epsilon_{t-q}$$

Where, Y_t is the predicted value, Y_{t-1} is the lag 1 of the series, β_1 is the coefficient of lag 1, α is the constant or the intercept term, ϵ_t is the random error at t, ϵ_{t-1} is the lagged error term at t-1, ϕ is the coefficient of lagged error at t-1.

A. Data Source

For this analysis and prediction the data is taken from the **Central Pollution Control Board (CPCB)**. Monthly data is taken from the 2016 to 2020 for the 6 surface water quality parameter and it is arranged in the MS Excel for the further calculation and the analysis. The following parameter which is taking in this study is Dissolved Oxygen, BOD, pH, Temperature, Electrical Conductivity and Total Coliform.

B. Data Statistics

The following data is observed on the stations :-

Station	Parameter	Temperature	DO	pH	Conductivity	BOD	TotalColiform
1062(S1)							
	Minimum	16.00	7.06	6.80	120.00	1.00	410.00
	Maximum	27.00	10.50	7.80	266.00	3.49	3500.00
	Mean	22.86	8.19	7.38	207.93	2.22	1021.93
	Std. deviation	2.68	0.76	0.23	32.87	0.59	775.99
1063(S2)							
	Minimum	14.00	6.00	6.89	201.00	2.40	2600.00
	Maximum	34.00	11.60	8.67	447.00	4.60	7900.00
	Mean	25.88	8.35	8.04	301.95	3.15	3993.33
	Std. deviation	5.65	1.39	0.43	64.45	0.45	772.60
1067(S3)							
	Minimum	15.00	5.80	6.99	203.00	2.50	3200.00
	Maximum	33.00	11.60	8.70	468.00	4.80	8400.00
	Mean	26.28	7.89	8.04	317.31	3.40	4815.52
	Std. deviation	5.34	1.42	0.40	70.90	0.51	949.39
1068(S4)							
	Minimum	15.00	2.80	7.11	223.00	3.20	28000.00
	Maximum	33.00	10.30	8.58	819.00	8.80	130000.00
	Mean	26.03	6.58	7.86	401.90	5.54	66266.67
	Std. deviation	5.63	1.68	0.39	121.08	1.51	29719.52

III. RESULT AND DISCUSSION

Model performance was estimated by RMSE, MAPE, AIC and R^2 for the water quality parameters Dissolved Oxygen, BOD, pH, Temperature, Electrical Conductivity and Total Coliform. In summary, the ARIMA model performed significantly better prediction of temperature, total coliform and conductivity in compare of other water quality parameter pH, BOD and DO. Furthermore, different prediction performance can be found for the four sites. The results for monthly surface water quality are shown in Figure 3, 4, 5 and 6.

The prediction of station S1 are –

IV. CONCLUSIONS

The paper shows the prediction efficiency and error on the all selected locations for which analysis is done. The results shows for S1 station that this model is able to predict the best value for the total coliform with 0.84 R^2 value and conductivity has lower value 0.5 R^2 . However, station S2 has highest efficiency 0.8 for the temperature and min value 0.612 for the BOD. station S3 has highest efficiency .85 for the total coliform and min value 0.58 for the DO. station S4 has highest efficiency .83 for the temperature and min value 0.52 for the conductivity.

Station	Parameter	Temperature	DO	pH	Conductivity	BOD	TotalColiform
1062(S1)							
	RMSE	2.15	0.70	0.21	31.23	0.49	474.77
	MAPE	6.51	6.72	2.10	12.25	18.65	27.06
	AIC	183.41	104.67	-3.45	446.51	71.39	688.53
	R^2	0.66	0.612	0.63	0.5	0.71	0.84
1063(S2)							
	RMSE	4.19	0.99	0.43	60.94	0.42	810.61
	MAPE	12.88	9.83	4.25	15.98	9.15	12.12

	R^2	0.83	0.73	0.64	0.52	0.59	0.6

Figure 7; Performance of ARIMA model for different water quality parameter

In summary, we can see that ARIMA model is giving the better prediction of temperature, total coliform and conductivity in compare of other water quality parameter pH, BOD and DO. This complete analysis provides an information base to be used by regulators and policymakers for reconciling the competing interests in the Ganga river through delivering solutions to improve, monitor clean up, maintain water quality and restore its ecosystem.

V. ACKNOWLEDGEMENTS

The author wishes to express his paramount gratitude to Asst. Prof. Dr. Anirudh Gupta CED, IET Lucknow, their scholarly guidance and constructive feedback have been a source of inspiration and motivation to complete this paper and the Central Pollution Control Board (CPCB) for providing the essential data for conducting this paper.
