Abstract: The present study was conducted to determine the use pattern of power tiller, tractor and combine harvester. The data was collected with the help of a pre-structured questionnaire and interaction with selected farmers in three districts of Odisha. Namely Cuttack, Sonepur, and Khordha for the study. From each district, were selected three districts, and from each block, two villages were randomly selected. Young operators were relatively less careful primarily due to their age and maturity. On the contrary, it was observed that farmers in the age group of more than 35 years had proper experience and could handle minor troubles in their implements more efficiently. More than 50% of the operators were found in the age group of 35-50 years in all the districts as compared to 35% for age group 25-35 years and 15% for the age group below 25 years. The operators' educational qualification of 10th standard and above was found to be between 49-59% for power tillers as compared to 39-51% for tractors and 31-48% for combine harvester. The operators' educational qualification below 10th standard was found to be 53-65% for power tillers, 49-61% for tractors and 75-78% for combine harvesters. The rate of haring of power tiller amounting Rs.800.00 is noted in the districts with 5% deviation where as that of tractor was Rs 1500.00 with 15% deviation and for combine harvester was Rs 2500.00 with 10-15% deviation.

Keywords: Power Tiller, Tractor, Combine Harvester, Hiring Cost. Land Holding, Personal Interview.

I. INTRODUCTION

Odisha is considered as one of agriculturally dominant states of India. Nearly three-fourths of the state population is dependent on agriculture for survival. A large number of machinery equipments are necessary to be used on the farm in the process of farm mechanization. Farm power is considered to be an important input in agriculture which helps in timely operation of fields by operating different types of farm equipments and stationary machines. Mostly farming is done on small holdings. About three - fourths of farm holding belong to small and marginal farmers, one - fourths to semi, medium and large farm holding farmers. Manual farm workers and draught animals are integral sources of farm power. In almost all operations, the farming system continues to use manual labor, animal power and modern technology based machinery in almost all operations. Agricultural equipment and machinery have the capability of carrying out field operations in less time and having better quality.

II. MATERIALS AND METHODS

An inspection inquiry was planned in the villages of three districts of Odisha. Following points are followed:

- 1) To select the farmer who owned tractor/power tiller/combine harvester based on sampling procedures
- 2) Collect information on the tractors etc and implements in regards to their use, operating period, cost of operation, deterioration, and rebuild frequency and charges for the same.
- 3) To make a probability sampling so that the result should be unbiased and appropriate statistical tools can be applied for analysis.

Table 1 List of villages under study area

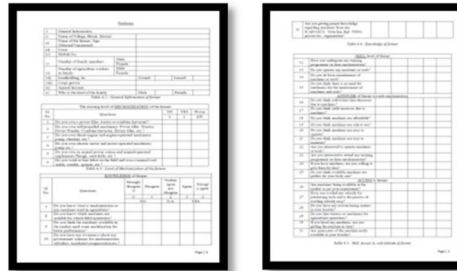

Sl.No.	Select Villages choose from the studyArea		
	District	Block	Village
1	Cuttack	Mahanga	Adamaheshpur
			Adhanga
		Salepur	Alipur
			Govindpur
		Niali	Nagari
			Usuma

2	Sonepur	Tarbha	Menda
			Baladi
		Biramaharajpur	Khandahata
			Nuapali
		Binika	Rengali
		Pipilipali	
3	Khordha	Jatani	Gramadhiha
			Gangapada
		Begunia	Abhilo
			Beleswar
		Balipatana	Achutpur
		Adalabad	

III. RESULTS AND DISCUSSION

A. Tractor ownership versus land Holding

To collect information from farmers the following questionnaire has been used for personal interaction.

QUESTIONARE

Information was based on ownership and use pattern of tractor implements system was analyzed from the data obtained from farmers owing tractor implement system. The land ownership patterns for the selected farmers of three selected districts namely Sonepur, Khordha, and Cuttack.

Table-3.1(OwnershipVS Land holding)

Category	Landholding(In-ha)	Percentageoftractor		
		Cuttack	Sonepur	Khordha
Marginal	<2	2	3	2
Small	2-4	12	7	10
Semi medium	4-6	22	24	23
Medium	6-12	24	27	21
Large	>12	47	48	49

Inference to this analysis 40-50 percent of medium land holding(4-10ha)farmer-owned tractors.

B. Distribution of Operator's Age in the Study Area

The age-wise distribution of tractor operators in the three districts Cuttack, Sonapur, and Khordha

Table-3.2(Age-wise distribution of power tiller operators)

Age	Percentage of the operator(%)		
	Cuttack	Sonapur	Khordha
<25	15.12	13.69	17.45
25-35	37.33	35.34	36.11
35-50	52.78	54.89	49.47

According to the questions, farmers reported young operators are relatively less careful due to their growing age . On the flip side, it was visible that farmers in the age group of greater than 35 years have proper experience in handling and can handle minor troubles in their tractors with more efficiency. It has been noticed that farmers give tractor operation in hands of young boys without considering the consequences of mishandling. These type of young boys use tractors sometimes in a fashion similar to cycle and scooter for showoff which may lead to mismanagement of tractor and tractor mishandling.

C. Education level of Operators/Farmers

Educational level-wise distribution of tractor operators/farmers in the three districts - Cuttack, Sonapur, and Khordha. The level of education of tractor operators is given in the (Table 4). In all the three districts, more than 38% of tractor operators are of 10th level. It is due to the age factor that many of the tractor operators are in the youth category. Similar results were found by Kumari and Kumari (2014) in Uttar Pradesh state of India where more than 60% of the tractor operators were educated up to high school or less.

Table-3.3(Educational level of operators)

Education level	Percentage of the tractor operator		
	Cuttack	Sonapur	Khordha
>10	38.89	48.33	51.22
<10	61.11	51.67	48.32

D. Distribution Patterns of Tractor age in the Study Area

Tractor age-wise distribution of tractors in the three districts-Cuttack, Sonapur, and Khordha.

Table-3.4(Distribution patterns of tractor age)

Year	Percentage of tractors year wise		
	Sonapur	Khordha	Cuttack
0-5	44.67	46.67	41.67
5-10	43.23	42.33	47.77
11-15	12.33	11.53	10.56

Aswese in(Table3.4)when the tractor age increases the use of that tractor decreases. These things happen because when the tractor age increase sit requiresmoremaintenanceascomparedtotheprimarystage,souserstrytobuyanewone.

E. Customer Hiring Rate of Tractors in Different Operations

The customer hiring rate of tractors, power tiller and combine harvester in different operations in the three districts Cuttack , Sonepur, and Khordha.

Table-3.5(Customer hiring ate of the tractor)

Operation	Rates(Rs./h)		
	Sonepur	Khordha	Cuttack
Power tiller	850	860	800
Tractor	1300	1350	1350
Combine harvester	2000	2000	2300

Diesel Consume -2to3.5L/hr-	600
Operator Cost-	200
Maintenance Cost-	200
Operation cost per hour-	1000
Profit(Varies from area to area)-	400
Total-	1400

The customer hiring rate difference is shown in three district is due to the availability of the implements, if in one area more equipment’s are there then the customer hiring rate of that area is less. But if in one area less equipment is there then the customer hiring rate is more.

F. Tractor fuel Consumption in Different Operations

The fuel consumption rate of the tractor in different operations in the three districts-Cuttack, Sonepur, and Khordha.

Table-3.6(Fuel consumption)

Operation	Horse power range wise fuel consumption(L/h)		
	15-25hp	25-35hp	55-60hp
Cultivator	3.5-4	4-5	5-6
Rotavator	4	6	7
Thresher	4-5	5-6	6-7

Here we see in tractor when the power is increases the fuel consumption is also increases and when the power is decreases the fuel consumption is also decreases.

G. Implements used in the Study Area

The availability of tractor drawn implements in the study areas is given in (Table-8). Tractor owners in the selected districts were having a good number of farm implements for tillage. In the three districts, all the tractor owners owned cultivators and trolleys. About30.56%,19.44%and38.89% farmers owned a leveler in Cuttack, Sonepur, and Khordha districts respectively.

Table-3.7(UseofImplements)

Implement	Cuttack		Sonepur		Khordha	
	No	%	NO	%	NO	%
Cultivator	40	100	38	100	44	100
Leveler	9	64.33	11	70.23	14	73.23
Seed-fertilizerdrill	40	100	39	100	43	100
Trailer/Trolley	43	100	42	100	46	100
Tractor	63	100	58	100	68	100

H. Use of Tractor in Agricultural and nonagricultural Study Area

Use pattern of tractors for agricultural and non-agricultural job is presented in (Table 9). Cuttack, Sonepur, and Khordha districts recorded 31.97%, 37.46% and 31.29% for agricultural use, respectively and 68.03%, 62.54% and 68.77% for non-agricultural use. The use of tractors for non-agricultural activities was mainly limited to transportation of construction material from one location to another. The results were synonymous to those obtained by a study in Himachal Pradesh. The tractors were used more for non-agricultural purposes (62% of annual working hours) as compared to agricultural operations.

Table-3.8(Agricultural and non-agricultural use of tractor)

Operation	Annual use in hours (%)		
	Cuttack	Sonepur	Khordha
Agriculture	33.97	37.46	31.29
Non-agriculture	66.03	62.54	68.77

I. Women Worker in Different Agriculture field Operation

Table-3.9(Women workers in different operations)

Different field operation	Percentage of women(%)		
	Cuttack	Sonepur	Khordha
Transplanting	60	56	59
Weeding	99	98	99
Cutting	39	36	38
Winnowing	20	23	21

80% of all economically active women in India are employed in agricultural sector. They contribute about one third of the agricultural labour force and nearly 48% of the self-employed farmers. In India, nearly 85% of rural women are engaged in agricultural activities but they own only about 13% of land.

The socio-economic profile of the farmers revealed that the average age of the head of the farm family ranges from 35 to 52 years. From the data of the sample farmers, nearly 55 % have middle school level education, 21 % in high school education, 12 % in higher secondary/college education and the remaining farmers are found to be illiterate.

The majority i.e. 46% of medium farmers (4-5 ha), 23.34 % of semi medium farmers (2-4 ha), and 21 % of small size farmers (1-2 ha) followed by 1.34 % marginal farmers category (less than 1 ha) have preference of purchasing tractor over power tiller . This scenario may be due to versatile nature of the tractor for carrying out most of the farm operations and transportation work.

Only about 15.2 % of the farmers have training for proper use and maintenance of tractors and about 55 % of them have a driving license for driving of tractor. Nearly ninety percent of farmers are facing the difficulty in maintaining draught animals, about 64 % of the farmers have problems regarding non availability of labour during peak agricultural operation season and about 61 % have problems of timely completion of farm operations. The above reasons were stated by the farmers for opting for the buying of farm tractor.

IV. ACKNOWLEDGMENT

We are highly thankful to our Principal Dr Sarat Kumar Maharana for his inspiration and support. We also sincerely thank our department faculty members and staff for their help without which it would have been difficult for us to complete the project.

V. CONCLUSION

- 1) Average annual use of tractor was found out to be 1,772.62 hours. However, tractor usage were of less time in actual agricultural operations. This may further increase if threshing operation is also carried out through the tractor engine.
- 2) Tractors are being used for the use by farmers as well as for custom work. The tractor use percentage for their own work was 29.53 % and for the rest of the time, the tractor was used for custom hiring work.
- 3) Average cost of operation of the tractor was initially higher and afterwards there is a decreasing trend with the increase in age.
- 4) Break-even point of the tractor increased with the increase in the size of the tractor. The maximum break-even point was observed as 685.20 hours in case of 26.11 kW tractors.
- 5) The purchase and use of a tractor was profitable in the study area since average annual use in each case was found to be higher than the break -even point.
- 6) All the tractor owned farmers have cultivator and trolley but no farmer have the ownership of harvesting machinery. Thus, there existed a clear gap of machinery ownership.
- 7) The maximum failure recorded for brake malfunctioning, gear damage and wearing of clutch plate.
