Vehicle Damage Analysis

Shubham Bhoite[1], Suhas Waghe[2], Aditya Karbhari[3], Kaushal Salve[4], Prof. Mrs. M. P. Desai[5]
Department of Information Technology, Smt. Kashibai Navale College of Engineering, Pune, India

Abstract: ***Vehicle damage, resulting from accidents, environmental factors, and everyday use, presents a ubiquitous challenge to vehicle owners and the broader automotive industry. An efficient and accurate vehicle damage assessment is essential for insurance claims, resale valuations, and overall vehicle safety. However, the traditional damage assessment methods often involve human subjectivity and can be time-consuming, leading to inefficiencies and customer dissatisfaction. This abstract explores the need for modernizing and automating the vehicle damage assessment process. Vehicle damage analysis plays a crucial role in accident reconstruction, insurance claims, safety assessment, and legal proceedings. This abstract provides an overview of the key aspects of vehicle damage analysis, including the methods and tools used, as well as its broader implications. Vehicle damage analysis involves the systematic examination and assessment of damage sustained by vehicles involved in accidents, incidents, or natural disasters. This process is essential for determining the cause and severity of the damage, estimating repair costs, and establishing liability in legal cases.***

This abstract highlights the multifaceted nature of the problem, encompassing the need for accurate and efficient damage detection, cost estimation, integration with insurance systems, and improved customer experiences. Addressing these challenges requires the application of advanced technologies such as computer vision, artificial intelligence, and machine learning, as well as a commitment to data security, privacy, and regulatory compliance.

I. INTRODUCTION

Vehicle damage analysis is a crucial aspect of the automotive industry, playing a vital role in insurance claims processing, accident investigation, and vehicle repair. Traditional methods for vehicle damage assessment often rely on manual inspection and human expertise, which can be time-consuming, subjective, and prone to errors. In this project, we aim to develop and implement an effective and reliable model to predict the damage percentage of the vehicle

1) Accurate damage identification: To develop a model that accurately identifies the type of damage present in an image, such as dents, scratches, cracks, and paint defects.
2) Efficient analysis: The CNN-based analysis process should be efficient and time-saving compared to traditional manual inspection methods.
3) Minimize time requirement: The model's key objective is to reduce time consumption in inspections.

II. LITERATURE SURVEY

Sr. No.	Topic Name	Year	Author	Description
1	Vehicle Damage Detection based on MD R-CNN	2023	Yuxin Chen, Hua Yuan*, Shoubin Dong	improve the positioning precision of detection, the regression of the detection box adopts a self-attention convolution head composed of a residual module and two SC Attention modules; Moreover, D-FPN is proposed to enhance the multi-scale detection performance.
2	Edge Intelligence Empowered Vehicle Detection and Image Segmentation for Autonomous Vehicles	2022	Chen Chen , Senior Member, IEEE, Chenyu Wang , Bin Liu, Ci He, Li Cong	Accordingly, first, we propose an edge intelligence-based improved-YOLOv4 vehicle detection algorithm, introducing an efficient channel attention mechanism and a high-resolution network to enhance vehicle detection ability
3	Research on Attitude Damage-Mitigating control of Air-breathing Hypersonic Flight Vehicles Based on Prescribed Performance	2022	Jianhua Li, d Yi Shen, Xuxin Bao	Firstly, established the flight vehicle's force model and the damage dynamics model. Secondly, the concept of induced angle of attack is introduced, and a longitudinal short-period attitude model of the flight vehicle is established considering elasticity.

Sr. No.	Topic Name	Year	Author	Description
4	Vehicle Damage Severity Estimation for Insurance Operations Using In-The-Wild Mobile Images	2022	DIMITRIOS MALLIOS1 , LI XIAOFEI1 , NIALL MCLAUGHLIN 2	Automatic car damage assessment using image data is an under-addressed problem highly relevant to the insurance industry.
5	Vehicle Damage Analysis Using Computer Vision: Survey	2022	Shreyansh Doshi, Amarjit Gupta , Jay Gupta	A segmentation method for detecting vehicle damage that is based on machine learning. When submitting insurance claims, using photos taken at the scene of an accident can expedite the process and save time and money while also improving driver convenience
6	Towards a Camera-Based Road Damage Assessment and Detection for Autonomous Vehicles: Applying Scaled-YOLO and CVAE-WGAN	2021	Pascal Fassmeyer, Felix Kortmann, Paul Drews	The data consists only of smartphone images, we also train expert models for autonomous driving utilizing vehicle camera data. In addition to detection, severity assessment is critical.

III. THE EXISTING SYSTEM AND NEED FOR A NEW SYSTEM

1) *Existing system:* Manual methods for vehicle damage assessment and repair are time-consuming, prone to human error, and lack consistency due to individual judgment and expertise. These processes often lead to delays, causing frustration for vehicle owners and inefficiencies within the automotive industry.
2) *Need for a new system:* There is a critical need for an automated system that integrates advanced technologies to streamline the assessment and repair process. Such a system would improve efficiency, reduce errors, and enhance the overall customer experience by providing transparency, cost-effectiveness, and compliance with regulations while promoting environmental sustainability.

IV. METHODOLOGY

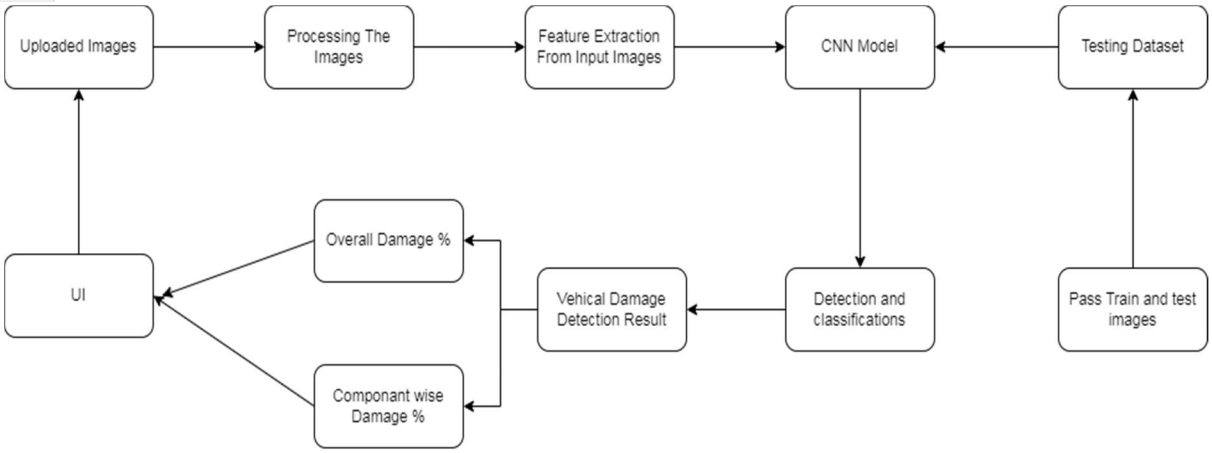
Vehicle damage analysis using Convolutional Neural Networks (CNNs) involves a series of steps that utilize the power of deep learning to accurately assess the extent and severity of damage to vehicles.

Key steps in our methodology:

1) *Data Collection:* Gather a large and diverse dataset of images containing various types of vehicle damage, including dents, scratches, cracks, and paint defects.
2) *Data Preprocessing:* Preprocess the images by normalizing their pixel values, resizing them to a standard size, and augmenting the dataset with techniques like flipping, rotating, and cropping to increase the model's generalization capabilities.
3) *Model Training:* Train the CNN model on the preprocessed and labeled image dataset. The model will learn to extract features from the images and use these features to classify the damage.
4) *Damage Detection:* Utilize the trained CNN model to analyze new images of damaged vehicles. The model will identify the type of damage present, such as dents, scratches, cracks, or paint defects.
5) *Damage Quantification:* Calculate the overall damage percentage and partwise percentage for each damaged area. This quantification will help in estimating the cost of repairs and making informed decisions about vehicle repair or replacement.

V. PROPOSED SYSTEM

The Vehicle damage analysis system consists of a user-friendly interface and a trained ML model for the calculation of damage percentage. The user interface can be used by a user to log into the system and give input images to the model. The output of the system will be displayed to the user using the interface. The model will be able to do tasks like taking inputs from the user, preprocessing the input images, feature extraction and training, and applying algorithms to calculate the damage percentage. The output of the model will be passed on to the user interface to be available to the user.



VI. RESULT AND DISCUSSION

VII. CONCLUSION

In conclusion, the implementation of Convolutional Neural Network (CNN) algorithms for vehicle damage analysis marks a significant advancement in the field of automotive assessment and repair. The utilization of CNNs provides a powerful tool for accurately and efficiently evaluating the extent of damage sustained by vehicles after an incident. This technology's ability to process and interpret visual data, such as images or videos of damaged vehicles, enables a nuanced and detailed analysis that goes beyond traditional methods.

Moreover, the CNN-based vehicle damage analysis system represents a transformative shift from traditional manual inspection methods. By automating the assessment process, the system minimizes the potential for human error and inconsistency, leading to more reliable and objective results. The continuous learning capabilities of machine learning models ensure adaptability to evolving patterns of damage, enhancing the system's effectiveness over time.
