Analysis of Sisal Fibre Composite

Abhay Shanker Mishra¹, Deeraj Kumar Verma²
^{1, 2} *muit lko*

I. INTRODUCTION

A. Background

In ancient history of composite, it was first time used by Egyptians and Mesopotamian which were construct strong and durable buildings with mixture of straw and mud about 1500s B.C. Later Mongols invented first bow which was made by mixture of bone, wood and animal glue [1]. But according “Mar-bal” incorporation history was composite around 3400 BC which was used by ancient Mesopotamians in ancient time. They created plywood using the glue and wood strips at different angles. Egyptians prepared death masks with composite about to 2181-2055 BC. In about 1200 AD Mongols invented first composite bow. The bow was small and accurate and had extremely strength. In 1800’s there was great revolution in the chemistry in which polymerization produces synthetic resins. In early 1900’s different type of plastics such as polyester, vinyl and phenolic was developed. First glass reinforced polymer composite was prepared in thirties. Unsaturated polyester was patented and epoxy was introduced in thirties. During the World War II composites were produced from the research. In this time requirement of different goods were produced by composite materials such as boat hulls and electronic equipment etc. the composite was commercialised after the WW II. In 1947 a fully composite automobile was prepared and tested. In 1950 there was revolution of manufacturing methods of composite such as pultrusion, resin moulding transfer and vacuum bag moulding etc. The carbon fibre composites were available commercially before but carbon fibre as patented in 1961. Carbon was improved the stiffness of the thermoset hence sports, marine, automobile product manufactured by the carbon reinforced composites. Polyethylene come into existence around late 1960’s. In the middle of 1990’s there was mainstream of composite manufacturing and construction. It was the cost effective and light weight and good replacement of traditional materials like metals and engineered plastics. Consumer uses composite in the form of handles, knobs, insulators and many applications. In middle of 2000’

II. MATERIALS

A. Matrix materials

Matrix materials are different types as discussed in details in last chapter such as metals, ceramics and polymers which are used in composite fabrication. Polymer matrix is very popular due to low cost and simple fabrication manufacturing methods as compared with ceramics and metals. As discussed polymer matrix is two types: thermosets and thermoplastics. In this work, thermoset polymers are selected. Thermosets are epoxy, polyester, phenolic and vinyl ester.

B. Flexural test

Flexural testing specimens are prepared as per standard ASTM D 790. The dimensions of the rectangular shaped flexural specimens are 80 mm × 20 mm × 3.2 mm with span length 48 mm. Figure 4.5 shows the specimens of flexural test for S20 composite. These specimens are also tested on the Tinius Olsen H 10 K-L (bi-axial testing machine, load capacity 10 kN, shown in Figure 4.4) with 2 mm/min crosshead speed. The flexural testing is done using a three-point bending test.

Flexural strength and flexural modulus are calculated by the following equations.

Figure 4.6 shows the solid works model for flexural test.

$$\text{Flexural strength} = \frac{3FL}{2bd}$$

$$\text{Flexural modulus} = \frac{mL}{4bd}$$

III. RESULT AND DISCUSSIONS

A. Mechanical properties

1) Impact test

Impact properties of epoxy and short sisal fibre reinforced epoxy composites are shown in Table 5.5 and Table 5.6 and graph is plotted with corresponding data which is shown in Figure 5.3. Impact properties have enhanced by the reinforcement of sisal fibre into epoxy matrix. It is observed that impact properties of S20 are found to maximum. Impact properties of S20 are found 387.57%, 294.46%, 102.23% and 50.29% more than E, S5, S10 and S15 respectively.

Table 5. 5 Impact test results of sisal fibre reinforced epoxy composites

Composites	Impact Energy (J)	S.D.	Impact Strength (kJ/m ²)	S.D.
E (a)	0.1457		6.0711	
E (b)	0.1328		5.5371	
E (c)	0.1296		5.4038	
E (d)	0.1340		5.5871	
E (e)	0.1380	0.0062	5.7538	0.2566
Avg.	0.1360	0.0062	5.6706	0.2566
S5 (a)	0.1719		7.1658	
S5 (b)	0.1695		7.0657	
S5 (c)	0.1780		7.4201	
S5 (d)	0.1645		6.8573	
S5 (e)	0.1567	0.0080	6.5321	0.3343
Avg.	0.1681	0.0080	7.0082	0.3343

IV. CONCLUSIONS

The conclusions drawn from the present investigations are as follows.

- A. Flexural strength is found maximum of S15 while flexural modulus is found of S10.
- B. Impact properties of sisal fibre reinforced composite are found maximum for the composite S20.
