Abstract: ***The concept of near mean Graph was introduced in [9]. A function f is called a near mean Labeling of graph G if $f: V(G) \to \{0, 1, 2, \ldots\ldots q-1, q+1\}$ is injective and the induced function $f^*: E(G) \to \{1, 2, \ldots\ldots q\}$ defined as***

$$f^*(e = uv) = \begin{cases} \dfrac{f(u)+f(v)}{2} & \text{if } f(u)+f(v) \text{ is even} \\ \dfrac{f(u)+f(v)+1}{2} & \text{if } f(u)+f(v) \text{ is odd} \end{cases}$$

is bijective. The graph which admits near mean labeling is called a near mean Graph. In this paper, we proved that $S(H_n)$: $(n: odd)$, $S(H_n)$ $(n: even)$, $S(P_n^+)$ are near mean graphs.

I. INTRODUCTION

We begin with simple, finite, connected and undirected graph $G = (V(G), E(G))$ with p vertices and q edges. For standard terminology and notations we follow (Harary, F., 1972). We will provide brief summary of definitions and other information which are prerequisites for the present investigations.

II. PRELIMINARIES

A function f is called a *near mean labeling* of graph G if $f: V(G) \to \{0, 1, 2, \ldots\ldots q\}$ is injective and the induced function $f^*: E(G) \to \{1, 2, \ldots\ldots q\}$ defined as

$$f^*(e = uv) = \begin{cases} \frac{f(u)+f(v)}{2} & \text{if } f(u)+f(v) \text{ is even} \\ \frac{f(u)+f(v)+1}{2} & \text{if } f(u)+f(v) \text{ is odd} \end{cases}$$

is bijective. The graph which admits near mean labeling is called a *near mean graph.*

1) *Definition 2.1.* Let G be a graph. For each vertex u of a graph G, take a new vertex v . Join v to those vertices of G adjacent to u . The graph thus obtained is called the *splitting graph* of G. It is denoted by $S(G)$. For a graph G, the splitting graph S of G is obtained by adding a new vertex v corresponding to each vertex u of G such that $N(u) = N(v)$ and it is denoted by $S(G)$.
2) *Definition 2.2.* Let H_n –graph of a path P_n is the graph obtained from two copies of P_n with vertices $v_1, v_2, v_3, \ldots\ldots\ldots, v_n$ and $u_1, u_2, u_3, \ldots\ldots\ldots, u_n$ by joining the vertices $v_{\frac{n+1}{2}}$ and $u_{\frac{n+1}{2}}$ by means of an edge if n is odd and vertices $v_{\frac{n}{2}+1}$ and $u_{n/2}$ if n is even.
3) *Definition 2.3.* $G_1 \Theta\ G_2$ of two graphs G_1 and G_2 is obtained by taking one copy of G_1 (with p vertices) and p copies of G_2 and then joining the ith vertex of G_1 to every vertex in the ith copy of G_2 . When $G_1 = P_n$ and $G_2 = mK_1$ we obtain $P_n \Theta$ mk_1 .

III. MAIN RESULTS

Theorem 3.1: $S(H_n)$: (n: odd) is Mean Graph.

Proof: Let $V[S(H_n)] = \{(u_i, v_i, u_i^1, v_i^1) : 1 \le i \le n\}$

$$E[S(H_n)] = \{[(u_iu_{i+1}) \cup (u_i^1u_{i+1}) : 1 \le i \le n-1] \cup [(v_iu_{i+1}) \cup (u_iv_{i+1}) \cup (v_i^1u^1_{i+1}) \cup (u_i^1v^1_{i+1}) : 1 \le i \le n-1] \cup (u_{(n+1)/2}u^1_{(n+1)/2}) \cup (v_{(n+1)/2}u^1_{(n+1)/2}) \cup (u_{(n+1)/2}v^1_{(n+1)/2})\}$$

Let $f : V[S(H_n)] \to \{0,1,2,\ldots\ldots,q\}$ by

$f(u_{2i-1}) = 2(i-1) \quad 1 \leq i \leq [n+1]/2$

$f(u_{2i}) = 4n-1+2(i-1) \quad 1 \leq i \leq [n-1]/2$

$f(v_{2i-1}) = 4n-2+2(i-1) \quad 1 \leq i \leq [n+1]/2$

$f(v_{2i}) = 2i-1 \quad 1 \leq i \leq [n-1]/2$

$f(v'_{n+2-2i}) = n+2(i-1) \quad 1 \leq i \leq [n+1]/2$

$f(v'_{n+1-2i}) = 5n-1+2(i-1) \quad 1 \leq i \leq [n-1]/2$

$f(u'_{n+1-2i}) = n-1+2i \quad 1 \leq i \leq [n-1]/2$

$f(u'_{n+2-2i}) = 5n-2+2(i-1) \quad 1 \leq i \leq [n-1]/2$

$f(u'_1) = 6n-2$

The induced edge labeling are

$f^*(u_iu_{i+1}) = 2n+i-1 \quad 1 \leq i \leq n-1$

$f^*(u_{2i-1}v_{2i}) = 2i-1 \quad 1 \leq i \leq [n-1]/2$

$f^*(u_{2i}v_{2i+1}) = 4n+2(i-1) \quad 1 \leq i \leq [n-1]/2$

$f^*(v_{2i-1}u_{2i}) = 4n-1+2(i-1) \quad 1 \leq i \leq [n-1]/2$

$f^*(v_{2i}u_{2i+1}) = 2i \quad 1 \leq i \leq [n-1]/2$

$f^*(u^1_{n+1-i}u^1_{n-i}) = 3n+i-1 \quad 1 \leq i \leq n-1$

$f^*(v^1_{n+2-2i}u^1_{n+1-2i}) = n+2i-1 \quad 1 \leq i \leq [n-1]/2$

$f^*(v^1_{n+1-2i}u^1_{n-2i}) = 5n+2(i-1) \quad 1 \leq i \leq [n-1]/2$

$f^*(v^1_{n+1-2i}u^1_{n+2-2i}) = 5n-1+2(i-1) \quad 1 \leq i \leq [n-1]/2$

$f^*(v^1_{n-2i}u^1_{n+1-2i}) = n+2i \quad 1 \leq i \leq [n-1]/2$

$f^*(u_{(n+1)/2}u^1_{(n+1)/2}) = 3n-1$

$f^*(v_{(n+1)/2}u^1_{(n+1)/2}) = n \quad \text{if } n \equiv 3 \pmod 4$

$f^*(v_{(n+1)/2}u^1_{(n+1)/2}) = 5n-2 \quad \text{if } n \equiv 1 \pmod 4$

$f^*(v^1_{(n+1)/2}u_{(n+1)/2}) = 5n-2 \quad \text{if } n \equiv 3 \pmod 4$

$f^*(v^1_{(n+1)/2}u_{(n+1)/2}) = n \quad \text{if } n \equiv 1 \pmod 4$

Hence, distinct induced edge labels shows that $S(H_n)$ (n : odd) is a Mean graph. For example, $S(H_5)$ and $S(H_7)$ are Mean Graph an shown in the figure 3.2 and 3.3 respectively.

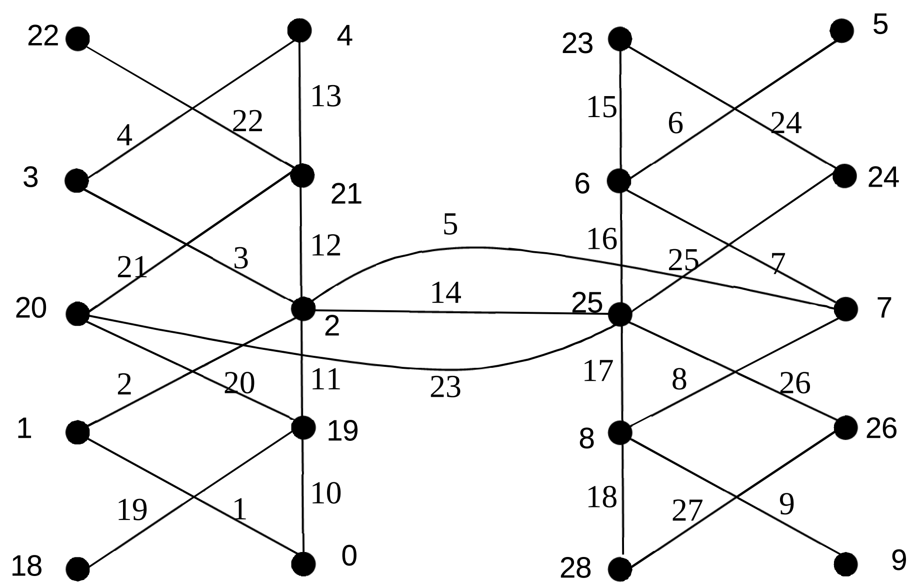

Figure 3.2 $S(H_5)$: $n \equiv 1 \pmod 4$

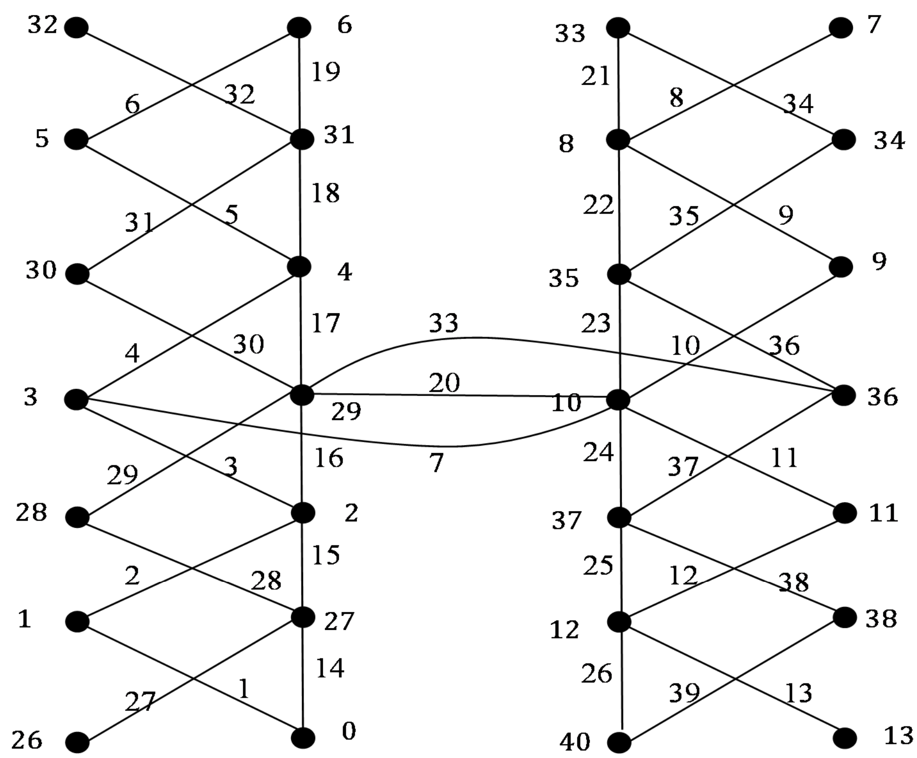

Figure 3.3 $S(H_7)$: $n \equiv 3 \pmod 4$

Theorem 3.4 : $S(H_n)$ (n : even) is Mean Graph.

Proof: Let $V[S(H_n)] = \{u_i, v_i, u_i^1, v_i^1 : 1 \le i \le n\}$

$E[S(H_n)] = \{[(u_i u_{i+1}) \cup (u_i^1 u^1_{i+1}) : 1 \le i \le n-1] \cup (u_{n/2} u^1_{[n/2]+1}) \cup [(v_i u_{i+1}) \cup (u_i v_{i+1}) : 1 \le i \le n-1]$
$\cup [(v_i^1 u^1_{i+1}) \cup (u_i^1 v^1_{i+1}) : 1 \le i \le n-1] \cup (v_{n/2} u^1_{(n/2)+1}) \cup (u_{n/2} v^1_{(n/2)+1})\}$

Let $f : V[S(H_n)] \rightarrow \{0, 1, 2, \ldots\ldots\ldots, q\}$

$f(u_{2i-1}) = 2(i-1)$ $1 \le i \le n/2$
$f(u_{2i}) = 4n-1+2(i-1)$ $1 \le i \le n/2$
$f(v_{2i-1}) = 4n-2+2(i-1)$ $1 \le i \le n/2$
$f(v_{2i}) = 2i-1$ $1 \le i \le n/2$
$f(u^1_{2i-1}) = n+2(i-1)$ $1 \le i \le n/2$
$f(u^1_{2i}) = 5n-1+2(i-1)$ $1 \le i \le [n/2]-1$
$f(u_n') = 6n-2$
$f(v^1_{2i-1}) = 5n-2+2(i-1)$ $1 \le i \le n/2$
$f(v^1_{2i}) = n+1+2(i-1)$ $1 \le i \le n/2$

The induced edge labeling are

$f^*(u_i u_{i+1}) = 2n+i-1$ $1 \le i \le n-1$
$f^*(u_{2i-1} v_{2i}) = 2i-1$ $1 \le i \le n/2$
$f^*(u_{2i} v_{2i+1}) = 4n+2(i-1)$ $1 \le i \le [n/2]-1$
