Analysis of Delays in Building Construction Projects

Manoj Sharma¹, Dr. A .S. Trivedi², Akshay Sharma³

¹Associate Professor, Civil IPS CTM Gwalior,

²Professor, Civil IPS CTM Gwalior,

³Research Scholar , M.Tech Civil (Construction Technology & Management)

Abstract: *Delay in Building Construction Project is one with all the foremost common issues. Delay can be defined as time overrun or an extension of time to complete the project. Delay is a situation when the actual progress of a construction project slower than the planned schedule or late completion of the projects. The causes of delay in Building Construction projects are a unit taken from the pass literature review. The literature reviews are a unit summarized and therefore the delay framework is made to support the literature review outline.*

Keywords: *Projects Delay, Effect, Construction, Questionnaire, Kruskal-Wallis Test.*

I. INTRODUCTION

Delays are one amongst the most important issues facing by the development trade. The delays in construction project have important money and social impact to all or any parties concerned within the project. Construction delay could be a major downside facing by the development trade. In most construction comes, there ar delays and their impact level varies from project to project starting from a couple of days to years. It is typically understood that the development delay is that the most important factors moving to deliver the project on time, within budget, and expected quality. It can be found rarely that a project was completed within the specified time. There are varied negative effects of delays like lawsuits between homeowners and contractors, increased costs, loss of productivity and revenue, and contract termination. Effects of delays that preponderantly effects or loss of Interest by the neutral, blacklist by the Authorities, waste of Money and Time, Declination of Reputation etc. Delays caused by contractors will typically be attributed to poor social control skills. Lack of planning and a poor understanding of accounting and financial principles have led to many a contractor's downfalls. In this study, the most important factors inflicting delay and their effects in the massive residential construction comes in India..

II. OBJECTIVE OF STUDY

- A. To identify the causes of delays in construction projects.
- B. To study analysis of delay and methods to mitigate delays.
- C. To study the effect of delays in construction projects.

Types of delay

Many construction projects suffer from delay. Suspension means a stoppage of work directed to the contractor by a form from the client, while delay is a slowing down of work without stopping it entirely

- 1) *Critical or non-critical Delays:* Delays that affect the project completion or in some cases a milestone date are considered as critical delays, and delays that do not affect the project completion, or a milestone date, is noncritical delays.
- 2) *Excusable or non-excusable Delays:* All delays are either excusable or non-excusable. An excusable delay is a delay that is due to an unforeseeable event beyond the contractor's or the subcontractor's control.
- 3) *Compensable or non-compensable delays* A compensable delay is a delay where the contractor is entitled to a time extension and to additional compensation. Relating back to the excusable and non excusable delays, only excusable delays can be compensable. Compensable delays are caused by the owner or the owner's agents.
- 4) *Concurrent or Non-Concurrent Delays:* The concept of concurrent delay has become a very common presentation as part of any analysis of construction delays. The concurrency argument is not just from the standpoint of determining the project's critical delays, but from the standpoint of assigning responsibility for damages associated with delays to the critical path.

IV.RESEARCH METHODOLOGY

The research methodology contains two phases. The first phase included a literature review and interviews. The literature review was conducted through books and international management journals. As the outcome of this phase, 18 delay factors causes of delays in construction projects were identified. These causes are :Approval, Materials related, Labours related , Equipment related, Financial issues & Cash flow, Mistakes during construction, Government policies, Client related, Contractor related, Prefeasibility studies, Deviation in drawings/Design related, Weather condition & Environmental factors, accidents, quality control/assurance, economic condition, Agreement issues, Ad0ption of advanced technology. The second phase includes the ranking of the uncertainty factors which are causes of delays in construction projects. These factors are ranked by the Relative Importance Index (RII).

A. Data Analysis

The data analysis will be done by a relative importance index technique Relative Importance Index technique: S.M.Renuga and Balasubramanian Malathi[1] used the Relative Importance Index method to determine the relative importance of the various cause of delays. The same method is going to be adopted in this study. The five-point scale ranged from 1(not much) to 5 (very important) will be adopted and will be transformed to relative importance indices (RII) for each factor as follows:

$$RII = \sum W/A * N \tag{1}$$

Where, W is the weighting given to each factor by the respondents (ranging from 1 to 5), A is the highest weight (i.e. 5 in this case), and N is the total number of respondents. The RII value had a range from 0 to 4 (0 not inclusive), higher the value of the RII, more important was the causes of delays. The RII was used to rank the different uncertainty factors that cause delay. These ranking made it possible to cross-compare the relative importance of the uncertainty factors as perceived by the respondents.

B. Questionnaire Survey

The Questionnaire was completed at the meeting with the project manager, planning engineer this method had the added benefit of making a clarification to respond about the uncertainty factors and gives chances to surveyor to explore possible uncertainty factors influencing the construction projects. These uncertainty factors in means of importance scale are carried out by the relative importance index method (RII).The uncertainty factors are ranked according to the RII values and the top 10 uncertainty factors are identified.

C. Applicability of Test Results to Construction Industry

The Kruskal–Wallis H test, or one-way ANOVA on ranks is a non-parametric method for testing whether samples originate from the same distribution. It is used for comparing two or more independent samples of equal or different sample sizes. It extends the Mann–Whitney U test, which is used for comparing only two groups. The parametric equivalent of the Kruskal–Wallis test is the one-way analysis of variance (ANOVA). Rank all data from all groups together; i.e., rank the data from 1 to N ignoring group membership. Assign any tied values the average of the ranks they would have received had they not been tied.

The test statistic is given by:

$$H = \left[\frac{12}{N(N+1)} * \frac{\sum TC^2}{n_c} \right] - 3 * (N+1)$$

Where, N is the total number of participants. Tc is the rank total for each group. nc is the number of participants in each group

V. CONCLUSIONS

- A. The aim of this paper is to identify the delay factors in construction projects because delays are considered to be a serious problem in the construction industry.
- B. Construction delay is a critical function in construction projects.
- C. According to RII method of analysis of factors top ten delay factors was Inclement weather conditions, Price fluctuation, Lack of skilled labour, Labour injuries, Poor site management, Unforeseen site condition, Low productivity are more important to resolve as they contribute a significant portion of delay in a project. Factors analysis represent eight significant factors responsible for delay of a project and how these factors are related to each other.
