Scrutiny of Risks Factors in Construction Projects

Manoj Sharma¹, Dr. A. S.Trivedi², Neha Madhan³ ¹Associate Professor, Civil IPS CTM Gwalior, RGPV University, Bhopal (M.P) / India ² Professor, Civil IPS CTM Gwalior, RGPV University, Bhopal (M.P) / India ³Research Scholar, M.Tech Civil IPS CTM Gwalior, RGPV University, Bhopal(M.P) / India

Abstract: The construction industry is widely associated with a high risk and uncertainty due to the nature of its operating environment. This study aims to identify and evaluate key risk factors and their frequency and severity and then their impact in different types of construction projects in India.

A questionnaire survey was conducted and a total of sixty five critical factors were identified and categorized into eight groups. These are: Financial related risk, Legal related risk, Management risk, Market related risk, Political and security related risk, Technical related risk, Environmental related risk, and Social related risk... The results are presented on the basis of their frequency, severity and importance.

Keywords:Risks,ProjectRiskManagement, Relative important index,F.I.Index,S.I Index, I.I Index

I. INTRODUCTION

The aim of this study is to conclude the prospect factors in industry, allotment of these factors, strategies used to traumatize risks and thus the techniques adopted in analysing these risks. the development project is exposed to a high degree of risk from the start of the project till the highest of the project.

Risk is printed as any event or prevalence which could have an impact on the action of project goals. Risk management in construction comes is to deal effectively with uncertainty and sudden events that might have an impact on palmy and timely completion of the project.

If risks don't seem to be known early throughout a project, it creates tons of exposure and uncertainties to the project life cycle, thereby touching such aspects as value, schedule and quality of the project. additionally, it'd additionally produce exposures within the space of Health, safety and surroundings.

Hence, risk management permits project managers to identify, analyze, respond and manage the risks of the project. this will be the rationale why risk management is extremely necessary for the palmy action for a project.

In drafting the contract, the getting strategy need to clearly outline the responsibilities of the consumer and therefore the contractor and such need to be specific and graspable. this will be to make positive that the prospect is clear for every the contractor and shopper thereby avoid future dispute.

The importance of risk management in construction comes are reportable by many authors. It had been completed that risk management is crucial to construction activities in minimizing losses and enhancing profitableness.

It had been explicit that risk management might be a way that need to be applied in associate trade to achieve the goals of the trade, thus it is necessary to unfold awareness and build interest amongst individuals to use risk management techniques within the trade. the prospect might be a measurable a neighborhood of uncertainty and is assumed as a deviation from the specified level, thus the prospect analysis is thus necessary for project choice and coordination of construction work.

II. OBJECTIVES

The main objectives of this study include the following:

- A. To identify the causes of risks in construction projects.
- B. To minimize the effect of risks in construction project..
- C. Ranking of the risk factors in accordance of their frequency, severity and importance.

III. LITERATURE REVIEW

	Table 1				
Past	Title of Research				
2010	Yasser Abdelghany, A.Samer Ezeidin- This paper focuses on the analysis of the different ICJV risk environments.				
2011	Hong-bo Zhou, S.e. M.ASCE and Hui Zhang- This methodology has five main parts: modeling of BNs,				
	determination of occurrence probabilities of risk events, assessment of consequences, calculations of risk value				
	and membership degree of risk rating, and definitions of risk acceptance criteria.				
2012	Hariharan Subramanyan, Priyadarshi H. Sawant and Vandana Bhatt - The risk response strategy suggested in this				
	paper will be useful in mitigating the adverse effects of risk in project completion in the Indian construction				
	industry.				
2013	Muhammad Saiful Islam - The main attention was paid to the identification of different types of risk and rating the				
	various risks arises in a project and assessing major risk factors. Besides, this research developed a risk				
	management framework for proper management of Bangladeshi construction projects.				
2015	Shahid Iqbal et al This study is based on findings of a questionnaire-based survey on risk management in				
	construction projects in Pakistan, reporting the significance of different type of risk, ultimate responsibility for				
	them and the effectiveness of some most common risk management techniques practiced in the industry				
2016	Greeshma R Krishnan, Minu Anna Johny - Proper management of all these processes is quite challenging for the				
	management team. Risk is nothing but the threats that occur during the project life cycle. Risk may be of various				
	kinds. There are various factors which affects the occurrence of these risks.				
2017	Paweł Szymański - The risk is present everywhere, in every area of life. One such area is the construction industry,				
	where risk is ever-present element of a great puzzle. Effective risk management does not apply to the resignation				
	of the risk, which is seemingly the cheapest option activity.				
2018	Dr. Chaiwat Pooworakulchai - This article studied the main application to risk management in the construction				
	industry by the sample texts document.				
2019	Ahsan Nawaz et al Risk management is a comparatively new field and there is no core system of risk				
	management in the construction industries of developing countries				

IV. METHODOLOGY

A questionnaire survey was conducted by construction professionals representing various stakeholders involved in construction projects in India

A. Questionnaire Design

The questionnaire was designed based on critical factors were identified that contributed to the causes of risks. A questionnaire survey was developed to assess the perceptions of various construction professionals of the relative importance of causes and the effects of construction risks. The questionnaire was designed into two sections: Section A; section B. Section A is to obtain the requested background information about the respondents. Section B is to obtain information on the factors that contribute to the causes of risks in construction projects from the perspective of construction professionals. A total sixty seven resources related factors were identified under three broad categories, namely manpower related, material related and equipment related issues. The critical factors are listed in Table 1. A five point Likert scale (1 very low, 2 low, 3 moderate, 4 high, 5 very high) was adopted where respondents were asked to rank the importance and impact of a particular factor on risks in one of their selected projects. Descriptive statistical techniques, namely Relative Importance Index (RII) has been used to highlight the relative importance of critical factors as perceived by the respondents (Assaf et. al, 1995; Faridi and El-Sayegh, 2006; Iyer and Jha, 2005; kmaraswamy and Chan, 1998).

B. Analysis of Data

The data obtained was analyses to determine the relative importance of the various factors that contribute to causes of construction delays.

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.177

Volume 7 Issue XII, Dec 2019- Available at www.ijraset.com

C. Relative Importance Index (RII)

Assess the relative significance among risks, previous literature work study suggests establishing a risk significance index by calculating a significance score for each risk. For Calculating the significance score, multiply the probability of occurrence by the degree of Impact. The significance score for each risk assessed by each respondent can be obtained through the model

$$\mathbf{S}_{\mathbf{j}}^{\mathbf{i}} = \mathbf{A}_{\mathbf{j}}^{\mathbf{i}} \mathbf{B}_{\mathbf{j}}^{\mathbf{i}}$$

Where Sij = Significance score assessed by respondent j for risk i

Aij = Occurrence of risk i, assessed by respondent j

Bij= degree of impact of risk I, assessed by respondent j.

By averaging scores from every one of the reactions, it is conceivable to get a normal importance score for each hazard, and this normal score is known as the hazard record score and is utilized for positioning the dangers. The model for the figuring of hazard list score can be characterized as

$$R_{s}^{i} = \sum_{j}^{T} = 1 S_{j}^{i} / T$$

Where R_s^{i} = index score for risk i

 S_{j}^{i} = Significance score assessed by respondent j for risk i

T= total number of responses

D. Design of the Survey

The respondents were requested to judge the total risk effect of each risk factor. The approach adopted is to consider two attributes for each risk: the probability level of the risk occurrence denoted by Frequency Index (F.I) and the degree of impact or the level of loss if the risk occurs denoted by Severity Index (S.I).By applying this approach, the respondents were asked to respond to the two attributes for each risk factor. For considering (F.I), the respondents were required to judge the probability level of risk occurrence by selecting one from among five levels, namely: Very small, Small, Normal, large, and Very Large. For considering (S.I) the respondents were asked to judge the degree of impact if the risk concerned occurs by selecting one from among five grades, namely: Very Low, Low, medium, High, and Very high.

E. Analysis Of Survey Results

To assess the relative significance among risks, previous literature study suggests establishing a risk significance index by calculating a significance score for each risk. For calculating the significance score is to multiply the probability of occurrence by the degree of impact. Thus, the significance score for each risk assessed by each respondent can be obtained

V. DATA ANALYSIS

Descriptive and frequency statistical analysis techniques were used to analyze the data collected in the survey. However, an advanced and accurate method is necessary to analyze the data in a systematic, fast and reliable way. For this purpose, the computer software Statistical Package for Social Science (SPSS 16) and MS Excel were selected.

The data collected from the survey were analyzed using the frequency and severity index method (Assaf and Al-Hejji, 2006) [5]. Details of both frequency and severity index analysis are explained below.

According to Assaf and Al-Hejji (2006), a formula as shown in equation (1) was used to rank risk factors based on frequency of occurrence as identified by the participants, which is called the Frequency Index (F.I).

Frequency Index (F. I.)(%)=
$$\frac{\sum_{n=1}^{\infty} a(n/N)}{5} \times 100$$
(1)

Where (a) is the constant expressing weighting given to each response (ranges from 1 for very small up to 5 for very high occurrence), n is the frequency of the responses, and N is the total number of responses. Similarly, a formula as shown in equation (2) used to rank risk factors based on severity index as indicated by the participants, which is called Severity Index (S.I).

$$\sum a(n/N)$$

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.177 Volume 7 Issue XII, Dec 2019- Available at www.ijraset.com

Where (a) is the constant expressing weighting given to each response (range from 1 for very low to 5 for very high effect), n is the frequency of the response, and N is the total number of responses. Importance Index: The importance index of each risk factor is calculated as a function of both frequency and severity indices, as follows:

Importance Index (I.I) (%) =

F.I (%) X S.I (%) 100

VI. CONCLUSION

In this study, identifying the risk factors faced by the construction industry is based on collecting information about construction risks, their consequences and corrective actions that may be done to prevent or mitigate the risk effects. The main point which was considered this research is to explore the key risk factors and identify these factors that could be faced in construction projects in India.
