Four Wheel Leaning Suspension Vehicle - A Review

Mr. Pranjal Rajankar¹, Mr. Anurag Choudhari², Mr. Bhushan Raut³, Ms. Sneha Patil⁴, Prof. B. A. Bohra⁵, Ms. Utkarsha Raut⁶

^{1,2,3,4}Final Year Student, ^{5,6}Assistant Professor, Mechanical Engineering,
Des'scoet Dhamangaon (Rly), Maharashtra, India

Abstract: Four wheel leaning suspension vehicles have been acknowledged as a mainstay in the industrial commercial and domestic domain. The idea is to change the perception remote area for actuating manual operated four wheel leaning suspension vehicle. Four wheel leaning suspension vehicles is a system combining many subsystems that interact among themselves as well as with the environment in which the four wheel leaning suspension vehicle works. In this vehicle, front swing and Rear swing, shockups, hinges, universal joint, end bearing, plane bearing, bearing with bearing hub, are the devices etc. designed to interact with the environment it is gradually making its headway into the domains of military, and vehicle applications domain. The use of four wheel leaning suspension in hilly as well as off road condition becoming more popular in recent years. The trend seems to continue as long as the leaning technology meets diverse and challenging needs of the producers.

Keywords: Front Swing, Rear Swing, Hinges, Universal Joint, End Bearing, Plane Bearing.

I. INTRODUCTION

A. History

This system remained the basis for all suspension systems until the turn of the 19th century, although the iron chains were replaced with the use of leather straps by the An early form of suspension on ox-drawn carts had the platform swing on iron chains attached to the wheeled frame of the 17th Century. Obadiah Elliott registered the first patent for a spring-suspension vehicle; - each wheel had two durable steel leaf springs on each side and the body of the carriage was fixed directly to the springs attached to the axles. Horse-drawn carriages and the Ford Model T used this system, and it is still used today in larger vehicles, mainly mounted in the rear suspension. Four wheel leaning suspension vehicle is an automatic or virtual intelligent agent that can be carried out any desired any leaning surface automatically with help of front and rear swings as well as shockup typically in practice vehicle is usually does not give the comfort and achieve any desired position in remote area hilly areas Four wheel leaning suspension vehicle are used with an increasingly wide verity of task such as for commercial applications. This vehicles used in hills stations remote areas and any inclined surface in any areas while developing this vehicle and implementation work The idea is to change the perception remote area for actuating manual operated four wheel leaning suspension vehicle. Four wheel leaning suspension vehicles is a system combining many subsystems that interact among themselves as well as with the environment in which the four wheel leaning suspension vehicle works.

B. Objective of Study

- 1) main objective of this vehicle is used for leaning purposes.
- 2) The goal of our project is to create a functioning double suspension system
- 3) The objective is to integrate our suspension system into a vehicle that we also design.

C. Scope of Study

The scope of this project are estimating the model and parameters of the passive system includes sprung mass and unstrung mass (spring constant of body, ski, damper coefficient, and spring constant of tire, kit) and choose the suitable model for the system by comparing the simulation and experimental results without controller.

II. CONSTRUCTIONAL FEATURES

A. Front Swing

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

Figure 2.1: Front swing

Front swing consist of round pipe square pipe, MS plate, end bearing, hinges and bearing with bearing hub. The function of front swing used to give the flexibility in vertical as well as horizontal direction the hinges and end plane bearing very important role in swing.

B. Rear Swing

Figure 2.2: Rear swing

Rear swing consist of round pipe square pipe, MS plate, plane bearing, hinges and bearing with bearing hub. The function of Rear swing used to give the flexibility in vertical direction the hinges and end plane bearing very important role in swing.

C. Power Transmutation System

Figure 2.3: Power Transmission system

Power from engine is transmitted to the one of the rear wheel of the vehicle with help of chain and sprocket mechanism, universal coupling, bearing with bearing hub the power from engine is transmit from engine shaft to the sprocket mechanism with help of chain then sprocket mechanism connected to the universal coupling due to this direction of power transmission is change. In this way power is transmitted engine shaft to the one of the rear wheel.

International Journal for Research in Applied Science & Engineering Technology (IJRASET)

III. WORKING

Figure 3.1: Working

As far as working is concerned when the vehicle starts power is transmitted from engine shaft to the chain sprocket with help of chain this chain sprocket is further connected. When any wheel is subjected to irregular surface that time another wheel will try to maintain stability of the vehicle. We can use this vehicle in hilly and remote areas as well as on road and off-road conditions also.

IV. APPLICATION

- A. Leaning suspension vehicle is used to avoid the damping effect.
- B. It also minimizes the shocks when driving.
- C. It offers comfort to the rider in off-road areas.

V. CONCLUSION

All related areas of the four-wheel leaning suspension vehicles have been covered including: selection of materials, various links, tilting mechanisms & fabrication of all linkages for better and smooth working.

BIOGRAPHIES

Mr. Pranjal R. Rajankar He was born in Dhamangaon (Rly), Dist. Amravati, Maharashtra, India in 1995. He completed his Diploma with First Class Distinction Division in Mechanical Engineering from L.A.M.I.T. Dhamangaon (rly) and pursuing B.E Degree in Mechanical Engineering from Sant Gadge Baba Amravati University (SGBAU), Amravati, India, in 2014-2017.

Mr. Anurag G. Choudhari He was born in Dhamangaon (Rly), Dist. Amravati, Maharashtra, India in 1995. He completed his Diploma with First Class Distinction Division in Mechanical Engineering from L.A.M.I.T. Dhamangaon (rly) and pursuing B.E Degree in Mechanical Engineering from Sant Gadge Baba Amravati University (SGBAU), Amravati, India, in 2014-2017.

Miss. Sneha S. Patil He was born in kharda , Dist. Yavatmal, Maharashtra, India in 1995. He completed his Diploma with First Class Division in Mechanical Engineering from L.A.M.I.T. Dhamangaon (rly) and pursuing B.E Degree in Mechanical Engineering from Sant Gadge Baba Amravati University (SGBAU), Amravati, India, in 2014-2017.

Mr. Bhushan N. Raut He was born in Pulgaon, Dist. Wardha, Maharashtra, India in 1995. He completed his 12th and pursuing B.E Degree in Mechanical Engineering from Sant Gadge Baba Amravati University (SGBAU), Amravati, India, in 2014-2017.

Miss. Utkarsha Raut He was born in Pophali , Dist. Yavatmal, Maharashtra, India in 1995. He completed his 12th and pursuing B.E Degree in Mechanical Engineering from Sant Gadge Baba Amravati University (SGBAU), Amravati, India, in 2014-2017.

Prof. Bhavesh A. Bohra He completed his B.E. in Mechanical Engineering from Ram Meghe Collage of Engineering Badnera, Amrawati in 2012. He also completed his M.E. in CAD/CAM from Amrawati in 2015. He registered for PhD. He has 4 years work experience as Assistant professor in DESCOET.
